#### MTH 302 LECTURE 1 COURSE OVERVIEW

#### COURSE TITLE

The title of this course is "BUSINESS MATHEMATICS AND STATISTICS".

#### Instructor's Resume

The instructor of the course is Dr. Zahir Fikri who holds a Ph.D. in Electric Power Systems Engineering from the Royal Institute of Technology, Stockholm, Sweden. The title of Dr. Fikri's thesis was "Statistical Load Forecasting for Distribution Network Planning".

#### <u>Objective</u>

The purpose of the course is to provide the student with a mathematical basis for personal and business financial decisions through eight instructional modules.

The course stresses business applications using arithmetic, algebra, and ratio-proportion and graphing.

Applications include payroll, cost-volume-profit analysis and merchandising mathematics. The course also includes Statistical Representation of Data, Correlation, Time Series and Exponential Smoothing, Elementary Probability and Probability Distributions.

This course stresses logical reasoning and problem solving skills.

Access to **Microsoft Excel** software is required for the course.

#### Course Outcomes

Successful completion of this course will enable the student to:

- 1. Apply arithmetic and algebraic skills to everyday business problems.
- 2. Use ratio, proportion and percent in the solution of business problems.
- 3. Solve business problems involving commercial discount, markup and markdown.
- 4. Solve systems of linear equations graphically and algebraically and apply to cost volumeprofit analysis.
- 5. Apply Statistical Representation of Data, Correlation, Time Series and Exponential Smoothing methods in business decision making
- 6. Use elementary probability theory and knowledge about probability distributions in developing profitable business strategies.

#### Unit Outcomes Resources/Tests/Assignments

Successful completion of the following units will enable the student to apply mathematical methods to business problems solving.

#### Required Student Resources (Including textbooks and workbooks)

Text: Selected books on Business Mathematics and Statistics.

## **Optional Resources**

Handouts supplied by the professor.

Instructor's Slides Online or CD based learning materials.

#### **Prerequisites**

The students are not required to have any mathematical skills. Basic knowledge of Microsoft Excel will be an advantage but not a requirement.

#### **Evaluation**

In order to successfully complete this course, the student is required to meet the following evaluation criteria:

Full participation is expected for this course

All assignments must be completed by the closing date.

Overall grade will be based on VU existing Grading Rules.

All requirements must be met in order to pass the course.

VU

The following are the main modules of this course: **Module 1** 

- Overview (Lecture 1)
- Perform arithmetic operations in their proper order (Lecture 2)
- Convert fractions their percent and decimal equivalents. (Lecture 2)
- Solve for any one of percent, portion or base, given the other two quantities. (Lecture 2)
- Using Microsoft Excel (Lecture 2) Calculate the gross earnings of employees paid a salary, an hourly wage or commissions. (Lecture 3)
- Calculate the simple average or weighted average given a set of values.
  - (Lecture 4)

Perform basic calculations of the percentages, averages, commission, brokerage and discount (Lecture 5)

- Simple and compound interest (Lecture 6)
- Average due date, interest on drawings and calendar (Lecture 6)

## Module 2

- Exponents and radicals (Lecture 7)
- Solve linear equations in one variable (Lecture 7)
- Rearrange formulas to solve for any of its contained variables (Lecture 7)
- Solve problems involving a series of compounding percent changes (Lecture 8)
- Calculate returns from investments (Lecture 8)
- Calculate a single percent change equivalent to a series of percent changes (Lecture 8)
- Matrices (Lecture 9)
- Ratios and Proportions (Lecture10)
- Set up and manipulate ratios (Lecture11)
- Allocate an amount on a prorata basis using proportions (Lecture11)
- Assignment Module 1-2

## Module 3

- Discounts (Lectures 12)
- Mathematics of Merchandising (Lectures 13-16)

#### Module 4

- Applications of Linear Equations (Lecture 17-18)
- Break-even Analysis (Lecture 19-22)
- Assignment Module 3-4
- Mid-Term Examination

### Module 5

- Statistical data (Lectures 23)
- Measures of central tendency (Lectures 24-25)
- Measures of dispersion and skewness (Lectures 26-27)

#### Module 6

- Correlation (Lectures 28-29)
- Line Fitting (Lectures 30-31)
- Time Series and Exponential Smoothing (Lectures 31-33)
- Assignment Module 5-6

## Module 7

- Factorials (Lecture 34)
- Permutations and Combinations (Lecture 34)
- Elementary Probability (Lectures 35-36)
- Patterns of probability: Binomial, Poisson and Normal Distributions (Lecture 37-40)

#### Module 8

- Estimating from Samples: Inference (Lectures 41-42)
- Hypothesis testing : Chi-Square Distribution (Lectures 43-44)
- Planning Production Levels: Linear Programming (Lecture 45)

Assignment Module 7-8 ٠

End-Term Examination •

Note: The course modules are subject to change.

## MARKING SCHEME

As per VU Rules DESCRIPTION OF TOPICS

NO.	MAIN TOPIC	LECTURE	TOPICS	RECOMMENDED READING
Module 1	1.0 Applications of Basic Mathematics (Lectures 1-6)	1	• Overviewew (Lecture 1)	Reference 1

## <u>Methodology</u>

There will be 45 lectures each of 50 minutes duration as indicated above. The lectures will be delivered in a mixture of Urdu and English. The lectures will be heavily supported by slide presentations. The slides for a lecture will be made available on the VU website for the course a few days before the actual lecture is televised. This will allow students to carry out preparatory reading before the lecture. The course will be provided its own page on the VU's web site. This will be used to

provide lecture and other supporting material from the course to the students. The page will have a link to a web-based discussion and bulletin board for the students. Teaching assistants will be assigned by VU to provide various forms of assistance such as grading, answering questions posted by students and preparation of slides.

#### **Grading**

There will be a term exam and one final examination. There will also be 4 assignments each covering two modules. The final exam will be comprehensive. These will contribute the following percentages to the final grade:

Mid Term Exam	35%
Final	50%
4 Assignments	15%

#### Text and Reference Material

The course is based on material from different sources. Topics for reading will be indicated on course web site and in professor's handouts, also to be posted on the course web site. A list of reference books will also be posted and updated on the course web site.

The following material will be used by the students as reference:

- Reference 1: Course Outline
  - 2: Instructor's Power Point Slides
  - 3: Business Mathematics & Statistics by Prof. Miraj Din Mirza
  - 4: Elements of statistics & Probability by Shahid Jamal
  - 5: Quantitative Approaches in Business studies by Clare Morris
  - 6: Microsoft Excel Help File

#### Schedule of Lectures

Given above is the tentative schedule of topics to be covered. Minor changes may occur but these will be announced well in advance.

#### LECTURE 2 Applications of Basic Mathematics Part 1

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Different course modules
- Basic Arithmetic Operations
- Starting Microsoft (MS) Excel
- Using MS Excel to carry out arithmetic operations

## **COURSE MODULES**

This course comprises 8 modules as under:

- Modules 1-4: Mathematics
- Modules 5-8: Statistics

Details of modules are given in handout for lecture 01.

#### **BASIC ARITHMETIC OPERATIONS**

Five arithmetic operations provide the foundation for all mathematical operations. These are:

- Addition
- Subtraction
- Multiplication
- Division
- Exponents

#### Example- Addition

12 + 5 = 17

#### Example- Subtraction

12 - 5 = 7

#### **Example- Multiplication**

12 x 5 = 60

#### Example- Exponent

 $(4)^{2} = 16$   $(4)^{1/2} = 2$  $(4)^{-1/2} = 1/(4)^{1/2} = \frac{1}{2} = 0.5$ 

#### MICROSOFT EXCEL IN BUSINESS MATHEMATICS & STATISTICS

Microsoft Corporation's Spreadsheet software **Excel** is widely used in business mathematics and statistical applications. The latest version of this software is **EXCEL 2002 XP**. This course is based on wide applications of **EXCEL 2002**. It is recommended that you install **EXCEL 2002 XP** software on your computer. If your computer has **Windows 2000** and **EXCEL 2000** even that version of EXCEL can be used as the applications we intend to learn can be done using the earlier version of **EXCEL**. Those of you who are still working with Windows 98 and have **EXCEL 97** installed are encouraged to migrate to newer version of **EXCEL** software.

# Starting EXCEL 2000 XP

EXCEL 2000 XP can be started by going through the following steps: Click **Start** on your computer Click **All Programs** Click **Microsoft Excel** 

The following slides show the operations:

The EXCEL window opens and a blank worksheet becomes available as shown below:

<b>K</b>	licrosoft E	xcel - I	Book1

The slide shows a Workbook by the name book1 with three sheets: Sheet1, Sheet2 and Sheet3. The Excel Window has Column numbers starting from A and row numbers starting from 1. the intersection of a row and column is called a **Cell**. The first cell is A1 which is the intersection of column A and row 1. All cells in a Sheet are referenced by a combination of Column name and row number.

**Example 1**: B15 means cell in column B and row 15.

Example 2: A cell in row 12 and column C has reference C12.

A **Range** defines all cells starting from the leftmost corner where the range starts to the rightmost corner in the last row. The Range is specified by the starting cell, a colon and the ending cell.

**Example 3:** A **Range** which starts from A1 and ends at D15 is referenced by A1:D15 and has all the cells in columns A to D up to and including row 15.

A value can be entered into a cell by clicking that cell. The mouse pointer which is a rectangle moves to the selected cell. Simply enter the value followed by the **Enter** key. The mouse pointer moves to the cell below.

If you make a mistake while entering the value select the cell again (by clicking it). Enter the new value. The old value is replaced by the new value.

If only one or more digits are to be changed then select the cell. Then double click the mouse. The blinking cursor appears. Either move the arrow key to move to the digit to be changed or move the cursor to the desired position. Enter the new value and delete the undesired value by using the **Del** key.

I suggest that you learn the basic operations of entering, deleting and changing data in a worksheet.

About calculation operators in Excel In Excel there are four different types of operators: Arithmetic operators Comparison operators Text concatenation operator Reference operators

The following descriptions are reproduced from Excel's Help file for your ready reference. In the present lecture you are directly concerned with arithmetic operators. However, it is important to learn that the comparison operators are used where calculations are made on the basis of comparisons. The text concatenation operator is used to combine two text strings. The reference operators include ":" and "," or ; as the case maybe. We shall learn the use of these operators in different worksheets. You should look through the Excel Help file to see examples of these functions. Selected material from Excel Help File relating to arithmetic operations is given in in a separate file.

The Excel arithmetic operators are as follows:

Addition. Symbol: +(Example: =5+4 Result: 9)Subtraction. Symbol: -(Example: =5-4 Result: 1)Multiplication. Symbol: \*(Example: =5\*4 Result: 20)Division. Symbol: /(Example: =12/4 Result: 3)Percent. Symbol: %(Example: =20% Result: 0.2)Exponentiation: ^(Example: =5\*2 Result: 25)

## Excel Formulas for Addition

All calculations in Excel are made through formulas which are written in cells where result is required.

Let us do addition of two numbers 5 and 10.

We wish to calculate the addition of two numbers 10 and 5. Let us see how we can add these two numbers in Excel.

- 1. Open a blank worksheet.
- 2. Click on a cell where you would like to enter the number 10. Say cell A15.
- 3. Enter 10 in cell A15.
- 4. Click cell where you would like to enter the number 5. Say cell B15.
- 5. Click cell where you would like to get the sum of 10 and 5. Say cell C15.
- 6. Start the formula. Write equal sign = in cell C15.
- 7. After =, write "(" (left bracket) in cell C15.
- 8. Move mouse and left click on value 10 which is in cell A15. In cell C15, the cell reference A15 is written.
- 9. Write "+" after "A15" in cell C15.
- 10. Move mouse and left click on value 5 which is in cell B15. In cell C15, the cell reference B15 is written.
- 11. Write ") " (right bracket) in cell C15.
- 12. Press Enter key

The answer 15 is shown in cell C15.

If you click on cell C15, the formula "=A15+B15" is displayed the formula bar to the right of fx in the Toolbar.

The main steps along with the entries are shown in the slide below. The worksheet MTH302-lec-02 contains the actual entries.

The next slide shows addition of 6 numbers 5, 10, 15, 20, 30 and 40. The entries were made in row 34. The values were entered as follows:

Cell A34: 5

Cell B34: 10

Cell C34: 15

Cell D34: 20

Cell E34: 30

Cell F34: 40

The formula was written in cell G34. The formula was:

=5+10+15+20+30+40

The answer was 120.

You can use an Excel function SUM along with the cell range A34:F34 to calculate the sum of the above numbers. The formula in such a case will be:

=SUM(A34:F34)

You enter "=" followed by SUM, followed by "(". Click on the cell with value 5(reference: A34). Drag the mouse to cell with value 40(reference: F34) and drop the mouse. Enter ")" and then press the Enter key.

In the above two examples you learnt how formulas for addition are written in Excel.

## Excel Formula for Subtraction

Excel formulas for subtraction are similar to those of addition but with the minus sign. Let us go through the steps for subtracting 15 from 25. Enter values in row 50 as follows:

Cell A50: 25 Cell B50: 15

Write the formula in cell C50 as follows: =A50-B50

To write this formula, click cell C50, where you want the result. Enter "=". Click on cell with value 25 (reference:A50). Enter "-"(minus sign). Click on cell with value 15 (reference B50). Press enter key.

If you enter 15 first and 25 later, then the question will be to find result of subtraction 15-25.

Let us look at the multiplication of two numbers 25 and 15. The entries will be made in row 60. Enter values as under:

Cell A50: 25 Cell B50: 15 The formula for multiplication is: =A50\*B50 Click on cell C50 to write the formula in that cell. Enter "=". Click on cell with number 25 (reference: A50). Enter "\*". Click on cell with number 15 (reference: B50). Press Enter key. The answer is 375 in cell C50.

#### Excel Formula for Division

The formula for division is similar to that of multiplication with the difference that the division sign "/" will be used.

Let us divide 240 by 15using Excel formula for division. Let us enter numbers in row 75 as follows:

Cell A75: 240 Cell B75: 15

The formula for division will be written in cell C75 as under: =A75/B75

The steps are as follows: Click the cell A75. Enter 240 in cell A75. Click cell B75. Enter 15. Click cell C75. Enter "=". Click on cell with value 240 (reference: A75). Enter "/". Click cell with number 15 (reference: B75). Press enter key. The answer 16 will be displayed in cell C75.

#### **Excel Formula for Percent**

The formula for converting percent to fraction uses the symbol %. To convert 20% to fraction the formula is as under:

=20%

If you enter 20 in cell A99, you can write formula for conversion to fraction by doing the following:

Enter 20 in cell A99. In cell B99 enter "=". Click on cell A99. Enter"%". Press Enter key. The answer 0.2 is given in cell B99.

## **Excel Formula for Exponentiation**

The symbol for exponentiation is ^. The formula for calculating exponents is similar to multiplication with the difference that the carat symbol ^ will be used. Let us calculate 16 raised to the power 2 by Excel formula for exponentiation. The values will be entered in row 85. The steps are: Select Cell A85. Enter 16 in this cell. Select cell B85 Enter 2 in this cell. Select cell C85. Enter"=". Select cell with value 16 (reference:A85). Enter "^". Select number 2 (reference: B85) Press Enter key.

The result 256 is displayed in cell C85.

## **Recommended Homework**

Download worksheet MTH302-lec-02.xls from the course web site. Change values to see change in results.

Set up new worksheets for each Excel operator with different values.

Set up worksheets with combinations of operations.

VU

#### LECTURE 3 Applications of Basic Mathematics Part 2

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Evaluations
- Calculate Gross Earnings
- Using Microsoft Excel

#### **Evaluation**

In order to successfully complete this course, the student is required to meet the evaluation criteria:

- Evaluation Criterion 1
- Full participation is expected for this course
- Evaluation Criterion 2
- All assignments must be completed by the closing date
- Evaluation Criterion 3
- Overall grade will be based on VU existing Grading Rules
- Evaluation Criterion 4
- All requirements must be met in order to pass the course

## <u>Grading</u>

There will be a term exam and one final exam; there will also be 4 assignments. The final exam will be comprehensive.

These will contribute the following percentages to the final grade:

Mid Term Exam 35% Final 50% 4 Assignments 15%

## <u>Collaborati</u>on

The students are encouraged to develop collaboration in studying this course. You are advised to carry out discussions with other students on different topics. It will be in your own interest to prepare your own solutions to Assignments. You are advised to make your original original submissions as copying other students' assignments will have negative impact on your studies.

#### <u>ETHICS</u>

Be advised that as good students your motto should be:

- No copying
- No cheating
- No short cuts

#### **Methodology**

There will be 45 lectures each of 50 minutes duration. The lectures will be delivered in a mixture of Urdu and Englis.

The lectures will be heavily supported by slide presentations.

The slides available on the VU website before the actual lecture is televised. Students are encouraged to carry out preparatory reading before the lecture.

This course has its own page on the VU's web site.

There are lecture slides as well as other supporting material available on the web site. Links to a web-based discussion and bulletin board will also been provided.

Teaching assistants will be assigned by VU to provide various forms of assistance such as grading, answering questions posted by students and preparation of slides

#### Text and Reference Material

This course is based on material from different sources. Topics for reading will be indicated on course web site and in professor's handouts. A list of reference books to be posted and updated on course web site. You are encouraged to regularly visit the course web site for latest guidelines for text and reference material.

#### **PROBLEMS**

#### If you have any problems with understanding of the course please contact: mth302@vu.edu.pk

#### Types of Employees

There may be three types of employees in a company:

- Regular employees drawing a monthly salary
- Part time employees paid on hourly basis
- Payments on per piece basis

To be able to understand how calculations of gross earnings are done, it is important to understand what gross earnings include.

#### **GROSS EARNINGS/SALARY**

Gross salary includes the following:

- Basic salary
- Allowances

Gross salary may include:

- Basic salary
- House Rent
- Conveyance allowance
- Utilities allowance

Accordance to the taxation rules if allowances are 50% of basic salary, the amount is treated as tax free. Any allowances that exceed this amount are considered taxable both for the employee as well as the company.

#### Example 1

The salary of an employee is as follows: Basic salary = 10,000 Rs. Allowances = 5,000 Rs. What is the taxable income of employee? Is any add back to the income of the company? % Allowances = (5000/10000) x 100 =50% Hence allowances are not taxable. Total taxable income = 10,000 Rs. Add back to the income of the company = 0

## Example 2

The salary of an employee is as follows: Basic salary = 10,000 Rs. Allowances = 7,000 Rs. What is the taxable income of employee? Is any add back to the income of the company? % Allowances =  $(7000/10000) \times 100 = 70\%$ Allowed non-taxable allowances =  $50\% = 0.5 \times 10000 = 5,000$  Rs. Taxable allowances = 70% - 50% = 7000 - 5000 = 2,000 Rs. Hence 2000 Rs. of allowances are taxable. Total taxable income = 10,000 + 2000 = 12,000 Rs. Add back to the income of the company = 20% allowances = 2,000 Rs.

#### **Structure of Allowances**

The common structure of allowances is as under:

- House Rent = 45 %
- Conveyance allowance = 2.5 %
- Utilities allowance = 2.5 %

## Example 3

The salary of an employee is as follows: Basic salary = 10,000 Rs. What is the amount of allowances if House Rent = 45 %, Conveyance allowance = 2.5 % and Utilities allowance = 2.5 %? House rent allowances = 0.45 x 10000 = 4,500 Rs. Conveyance allowance = 0.025 x 10000 = 250 Rs. Utilities allowance = 0.025 x 10000 = 250 Rs. Thus total allowances are 4500+250+250 = 5000Rs

#### Provident Fund

According to local laws, a company can establish a Provident Trust Fund for the benefit of the employees. By law, 1/11<sup>th</sup> of Basic Salary per month is deducted by the company from the gross earnings of the employee. An equal amount, i.e 1/11<sup>th</sup> of basic salary per month, is contributed by the company to the Provident Fund to the account of the employee. The company can invest the savings in Provident Fund in Government Approved securities such as defense saving Certificates. Interest earned on investments in Provident Fund is credited to the account of the employees in proportion to their share in the Provident Fund.

#### Example 4

The salary of an employee is as follows: Basic salary = 10,000 Rs. Allowances = 5,000 Rs. What is the amount of deduction on account of contribution to the Provident Trust Fund?

What is the contribution of the company?

What is the total saving of the employee per month on account of Provident Trust Fund?

Employee contribution to Provident Fund =  $1/11 \times 10000 = 909.1$  Rs. Company contribution to Provident Fund =  $1/11 \times 10000 = 909.1$  Rs. Total savings of employee in Provident Fund = 909.1 + 909.1 = 1,818.2 Rs.

## **Gratuity Fund**

According to local laws, a company can establish a Gratuity Trust Fund for the benefit of the employees. By law, 1/11<sup>th</sup> of Basic Salary per month is contributed by the company to the Gratuity Fund to the account of the employee. Thus there is a saving of 1/11<sup>th</sup> of basic salary on behalf of the employee in Gratuity Fund. The company can invest the savings in Gratuity Fund in Government Approved securities such as defence saving Certificates. Interest earned on investments in Gratuity Fund is credited to the account of the employees in the Gratuity Fund.

## Example 5

The salary of an employee is as follows: Basic salary = 10,000 Rs. Allowances = 5,000 Rs. What is the contribution of the company on account of gratuity to the Gratuity Trust Fund? Company contribution to Gratuity Fund

= Total savings of employee in Gratuity Fund = 1/11 x 10000 = 909.1 Rs.

#### Leaves

All companies have a clear leaves policy. The number of leaves allowed varies from company to company. Typical leaves allowed may be as under:

- Casual Leave = 18 Days per year
- Earned Leave = 18 Days per year
- Sick Leave = 12 Days per year

## Example 6

The salary of an employee is as follows: Basic salary = 10,000 Rs.

Allowances = 5,000 Rs.

What is the cost on account of casual, earned and sick leaves per year if normal working days per month is 22? What is the total cost of leaves as percent of gross salary?

Gross salary = 10000 + 5000 = 15,000 Rs.

Cost of casual leaves per year =  $\{18 / (22 \times 12)\} \times 15000 \times 12 = 12,272.7 \text{ Rs.}$ Cost of earned leaves per year =  $\{18 / (22 \times 12)\} \times 15000 \times 12 = 12,272.7 \text{ Rs}$ Cost of Sick leaves per year =  $\{12 / (22 \times 12) \times 15000 \times 12 = 8,181.8 \text{ Rs}$ Total cost of leaves per year = 12272.7 + 12272.7 + 8181.8 = 32,727.3 Rs.Total cost of leaves as percent of gross salary =  $(32727.3/(12 \times 15000)) \times 100 = 18.2\%$ 

#### Social Charges

Social charges comprise leaves, group insurance and medical. Typical medical/group insurance is about 5% of gross salary. Other social benefits may include contribution to employee's children's education, club membership, leave fare assistance etc. Such benefits may be about 5.8%. Leaves are 18.2% of gross salary (as calculated in above example)

Total social charges therefore may be = 18.2 + 5 + 5.8 = 29% of gross salary. Other companies may have more social benefits. The 29% social charges are quite common.

## Example 7

The salary of an employee is as follows: Basic salary = 10,000 Rs. Allowances = 5,000 Rs. What is the cost of the company on account of leaves (18.2%), group insurance/medical (5%) and other social benefits (5.8%)?

Leaves cost = 0.182 x 15000 = 2,730 Rs. Group insurance/medical = 0.05 x 15000 = 750 Rs. Other social benefits = 0.058 x 15000 = 870 Rs. Total social charges = 2730 + 750 + 870 = 4,350 Rs.

#### **SUMMARY**

Summary of different components of salary is as follows: Basic salary Allowances 50 % of basic salary Gratuity 9.09 % of basic salary Provident Fund 9.09 % of basic salary Social Charges 29 % of gross salary

**Gross remuneration** is pay or salary, typically monetary payment for services rendered, as in an employment. It includes.

- 1. Basic Salary
- 2. House rent allowance
- 3. Conveyance allowance
- 4. Utilities
- 5. Provident fund
- 6. Gratuity fund
- 7. Leaves
- 8. Group insurance (medical etc)
- 9. Miscellaneous social charges.

Benefits can also include more factors and are not limited to the above list.

The purpose of the benefits is to increase the economic security of employees

#### Example 8

The salary of an employee is as follows: Basic salary = 6,000 Rs.

## The calculations are shown in the slide below.

There is mistake in calculating gross remuneration in example given below. Total amount of leaves are 19636 which is the amount for 1 year not 1 month. So divide the amount of leaves by 12 and then calculate gross remuneration.

#### **Converting fraction to percent**

Calculate percent by multiplying fraction by 100. and put the percent sign (%) *Percent = Fraction X 100* 

#### Example 9

Convert 0.1 to percent. 0.1 X 100 = 10%

#### Common Fraction

Common fraction is a fraction having an integer as a numerator and an integer as a denominator. For example  $\frac{1}{2}$ ,  $\frac{10}{100}$  are common fractions.

Converting percent into Common Fraction <u>Example 11</u> 20% = 20/100 = 0.2

## Decimal fraction.

Any number written in the form: an integer followed by a decimal point followed by a (possibly infinite) string of digits. For example 2.5, 3.9 etc.

Converting percent into decimal fraction

## <u>Example</u>

 $\overline{20\%} = 0.2$ 

## Percent

20% or 20/100=0.2

## Percentage

Percentage is formed by multiplying a number called the base by a percent, called the rate. Thus

```
Percentage = Base x Rate

Example 13

What percentage is 20% x of 120?

Here, rate = 20% = 20/100 = 0.2

Base = 120

Percentage = 20/100 x 120

Or

0.2 X 120

= 24
```

## Example 14

```
What Percentage is 6 % of 40?
Percentage
= Rate X Base
= 0.06 X 40
=-2.4
```

## <u>Base</u>

Base = Percentage/Rate

## Example 15

Find base if **Rate = 24.0 % = 0.24 Percentage = 96 Base= 96/0.24=400** 

#### **OBJECTIVES**

The objectives of the lecture are to learn about: Review Lecture 3 Calculating simple or weighted averages Using Microsoft Excel

#### Gross Remuneration

The following slide shows worksheet calculation of Gross remuneration on the basis of 6000 Rs, basic salary.

As explained earlier, house rent is 45% of basic salary. Conveyance and Utilities Allowance are both 2.5% of basic salary. Both Gratuity and Provident fund are 1/11<sup>th</sup> of basic salary.

The arithmetic formulas are as follows: Excel formulas are within brackets. Basic salary = 6000 Rs.

House rent =  $0.45 \times 6000 = 2700 \text{ Rs.}$  (Excel formula: =\$B\$93\*0.45) Conveyance Allowance =  $0.025 \times 6000 = 150 \text{ Rs.}$  (Excel formula: =\$B\$93\*0.025) Utilities allowance =  $0.025 \times 6000 = 150 \text{ Rs.}$  (Excel formula: =\$B\$93\*0.025) Gross salary = 6000 + 2700 + 150 + 150 = 9000 Rs. (Excel formula: =SUM(B93:B96) Gratuity =  $1/11 \times 6000 = 545$  (Excel formula: =ROUND((1/11)\*\$B\$93;0)

In the Excel formulas the \$ sign is used before the row and column reference to fix the location of the cell. Since house rent, CA, utilities, gratuity and provident fund are calculated with respect to basic salary so by using \$B\$93, we fixes the location of cell B93. This feature can be used for quick and correct calculation of all allowances and benefits.

```

In Gratuity and provident calculations the function ROUND is used to round off values to desired number of decimals. In our case we used the value after the semicolon to indicate that no decimal is required. If you want 1 decimal use the value 1. for 2 decimals use 2 as the second parameter to the ROUND function. The first parameter is the expression for calculation 1/11\*\$B\$93.

In the calculation for social charges the formula is B93\*(29/100). Here 29/100 means 29% social charges. The \$ sign was not used here to explain another feature of excel. If the formula in cell D93 is copied to cell E93 (say), the cell reference B93 in formula changes to C93. \$B\$93 would be needed to fix the value of basic salary in cell E93.

## AVERAGE

Average (Arithmetic Mean) = Sum /N Sum= Sum of all data values N= number of data values EXAMPLE 1 Data: 10, 7, 9, 27, 2 Sum: = 10+7+9+27+2 = 55 There are 5 data values Average = 55/5 = 11

#### ADDING NUMBERS USING MICROSOFT EXCEL

- 1. Add numbers in a cell
- 2. Add all contiguous numbers in a row or column
- 3. Add noncontiguous numbers
- 4. Add numbers based on one condition
- 5. Add numbers based on multiple conditions
- 6. Add numbers based on criteria stored in a separate range
- 7. Add numbers based on multiple conditions with the Conditional Sum Wizard

#### 1. Add numbers in a cell

Type =5+10 in a cell Result 15. See Example  $\frac{2}{2}$ 

₹ N	A Microsoft Excel - Book1									
	<u>F</u> ile	<u>E</u> dit	<u>V</u> iew	Insert	F <u>o</u> rmat	<u>T</u> ools <u>D</u>	iata <u>W</u> indov	∧ <u>H</u> elp A	do <u>b</u> e PDF	
$\square$	1		5 X	Þ. (2	• 🚿	Ω + Ci	- Σ - Ε	🤉 🎽 Ari	al	
1		<b>t</b> a 2	1 10 1		<b>4</b>	Y Reply	with <u>C</u> hanges,	E <u>n</u> d Revie	w 🗸

2	Ν	UM	1+1	<b>NUN</b>	12					
3 4										
5	=5+	10								
ь 7										

#### 2. Add all contiguous numbers in a row or column using AutoSum

If data values are in contiguous cells of a column, click a cell next to last data value in the same column (If data values are in contiguous cells of a row then click a cell at right side of last data value)

Click AutoSum symbol,  $\boldsymbol{\Sigma}$  , in tool bar

Press ENTER This will add all the data values. See Example

🖾 Microsoft Excel - Book1

5. Add numbers based on multiple conditions

Use the IF and SUM functions to do this task

## 6. Add numbers based on criteria stored in a separate range

Use the DSUM function to do this task

#### DSUM

Adds the numbers in a column of a list or database that match conditions you specify. **Syntax** DSUM(database,field,criteria) Database is the range of cells that makes up the list or database. Field indicates which column is used in the function. Criteria is the range of cells that contains the conditions you specify. DSUM EXAMPLE =DSUM(A4:E10;"Profit";A1:F2) The total profit from apple trees with a height between 10 and 16 (75)

#### AVERAGE USING MICROSOFT EXCEL

AVERAGE Returns the average (arithmetic mean) of the arguments. Syntax AVERAGE(number1,number2,...) Number1, number2, ... are 1 to 30 numeric arguments for which you want the average.

#### Calculate the average of numbers in a contiguous row or column

# WEIGHTED AVERAGE:

Weighted average is one type of arithmetic mean of a set of data, in which some elements of the set carry more importance (weight) than others.

If  $\{x_1, x_2, x_3, \dots, x_n\}$  is a set of n number of data and  $\{w_1, w_2, w_3, \dots, w_n\}$  are corresponding weights of the data then

Weighted average =  $(x_1)(w_1) + (x_2)(w_2) + (x_3)(w_3) + \dots + (x_n)(w_n)$ 

# Be careful about one thing that the weights should be in fraction.

Grades are often computed using a weighted average. Suppose the weightage of homework is 10%, quizzes 20%, and tests 70%.

Here weights of homework, quizzes, tests are already in fraction i-e10% = 0.1, 20% = 0.2, 70% = 0.7 respectively.

If Ahmad has a homework grade of 92, a quiz grade of 68, and a test grade of 81then

Ahmad's overall grade = (0.10)(92) + (0.20)(68) + (0.70)(81)

= 79.5

Let us see another example

Grade of Labor	Labor hours per unit of labor	Hourly wages (Rs)
Skilled	6	300
Semiskilled	3	200
Unskilled	1	100

Here weights (Labor hours per unit of labor) are not in fraction. So first we convert them to fraction. Total labor hours =6 + 3 + 1 = 10

Grade of labor	Labor hours per unit of labor (in fraction)
Skilled	6/10 = 0.6
Semiskilled	3/10 = 0.3
Unskilled	1/10 = 0.1

Weighted average = (0.6)(300) + (0.3)(200) + (0.1)(100)

# = 250 Rs per hour

#### LECTURE 5 Applications of Basic Mathematics Part 4

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review of Lecture 4
- Basic calculations of percentages, salaries and investments using Microsoft Excel

#### PERCENTAGE CHANGE

Monday's Sales were Rs.1000 and grew to Rs. 2500 the next day. Find the percent change.

# METHOD

Change = Final value – initial value Percentage change = (Change / initial value) x 100%

### **CALCULATION**

Initial value =1000 Final value = 2500 Change = 1500 % Change = (1500/1000) x 100 = 150% The calculations using Excel are given below. First the entries of data were made as follows: Cell C4 = 1000 Cell C5 = 2500 In cell C6 the formula for increase was: =C5 – C4 The result was 1500. In cell C7 the formula for percentage change was: = C6/C4\*100 The result 150 is shown in the next slide.

#### LECTURE 6 Applications of Basic Mathematics Part 5

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 5
- Discount
- Simple and compound interest
- Average due date, interest on drawings and calendar

### **REVISION LECTURE 5**

A chartered bank is lowering the interest rate on its loans from

#### 9% to 7%.

What will be the percent decrease in the interest rate on a given balance?

#### A chartered bank is increasing the interest rate on its loans from 7% to

**9%** 

# What will be the percent increase in the interest rate on a given

### balance?

As we learnt in lecture 5, the calculation will be as follows:

Decrease in interest rate = 7-9 = -2 %

% decrease = -2/9 x 100 = -22.2 %

Increase in interest rate = 9-7 = 2 %

% decrease = 2/7 x 100 = 28.6 %

The calculations in Excel are shown in the following slides:

# DECREASE IN RATE

Data entry Cell F4 = 9 Cell F5 = 7

<u>Formulas</u> Formula for decrease in Cell F6: = =F5-F4 Formula for % decrease in Cell F7: =F6/F4\*100

#### <u>Results</u> Cell F6 = -2 Cell F7 = -22.2

INCREASE IN RATE Data entry Cell F14 = 7 Cell F15 = 9

Formulas Formula for increase in Cell F16: =F15-F14 Formula for % increase in Cell F17: =F16/F14\*100

<u>Results</u> Cell F16 = 2 Cell F17= 28.6

# The Definition of a Stock

Plain and simple, stock is a share in the ownership of a company. Stock represents a claim on the company's assets and earnings. As you acquire more stock, your ownership stake in the company becomes greater. Whether you say shares, equity, or stock, it all means the same thing.

# Stock yield

With stocks, yield can refer to the rate of income generated from a stock in the form of regular dividends. This is often represented in percentage form, calculated as the annual dividend payments divided by the stock's current share price.

# Earnings per share (EPS)

The EPS is the total profits of a company divided by the number of shares. A company with \$1 billion in earnings and 200 million shares would have earnings of \$5 per share.

# Price-earnings ratio

A valuation ratio of a company's current share price compared to its per-share earnings.

Calculated as:

# Market Value per Share Earnings per Share (EPS)

For example, if a company is currently trading at \$43 a share and earnings over the last 12 months were \$1.95 per share, the P/E ratio for the stock would be 22.05 (\$43/\$1.95).

# Outstanding shares

Stock currently held by investors, including restricted shares owned by the company's officers and insiders, as well as those held by the public. Shares that have been repurchased by the company are not considered outstanding stock.

# Net current asset value per share(NCAVPS)

NCAVPS is calculated by taking a company's current assets and subtracting the total liabilities, and then dividing the result by the total number of shares outstanding.

# NCAVPS= (Current Assets - Total Liabilities) #Of SharesOuts tanding

# Current Assets

The value of all assets that are reasonably expected to be converted into cash within one year in the normal course of business. Current assets include cash, accounts receivable, inventory, marketable securities, prepaid expenses and other liquid assets that can be readily converted to cash.

## Liabilities

A company's legal debts or obligations that arise during the course of business operations.

### Market value

The price at which investors buy or sell a share of stock at a given time

#### Face value

Original cost of a share of stock which is shown on the certificate. Also referred to as "par value." Face value is usually a very small amount that bears no relationship to its market price.

#### <u>Dividend</u>

Usually, a company distributes a part of the profit it earns as dividend.

For example: A company may have earned a profit of Rs 1 crore in 2003-04. It keeps half that amount within the company. This will be utilised on buying new machinery or more raw materials or even to reduce its borrowing from the bank. It distributes the other half as dividend.

Assume that the capital of this company is divided into 10,000 shares. That would mean half the profit -- ie Rs 50 lakh (Rs 5 million) -- would be divided by 10,000 shares; each share would earn Rs 500. The dividend would then be Rs 500 per share. If you own 100 shares of the company, you will get a cheque of Rs 50,000 (100 shares x Rs 500) from the company.

Sometimes, the dividend is given as a percentage -- i e the company says it has declared a dividend of 50 percent. It's important to remember that this dividend is a percentage of the share's face value. This means, if the face value of your share is Rs 10, a 50 percent dividend will mean a dividend of Rs 5 per share

#### **BUYING SHARES**

If you buy 100 shares at Rs. 62.50 per share with a 2% commission, calculate your total cost.

#### **Calculation**

 $\begin{array}{rll} 100 & * Rs. \ 62.50 = & Rs. \ 6,250 \\ 0.02 & * Rs. \ 6,250 = & & \underline{125} \\ Total & = & Rs. \ 6,375 \end{array}$ 

#### **RETURN ON INVESTMENT**

Suppose you bought 100 shares at Rs. 52.25 and sold them after 1 year at Rs. 68. With a 1% commission rate of buying <u>and</u> selling the stock and 10 % dividend per share is due on these shares. Face value of each share is 10Rs. What is your return on investment?

# **Bought**

100 shares at Rs. 52.25 = 5,225.00 Commission at 1% = 52.25 =5,225 + 52.25 = 5,277.25 Total Costs Sold 100 shares at Rs. 68 = 6,800.00 Commission at 1% = -68.00 = 6,800 - 68 = 6,732.00 Total Sale Gain Net receipts = 6,732.00 Total cost = - 5,277.25 Net Gain = 6,732 - 5,277.25 = 1,454.75 Dividends (100\*10/10) = 100.00 Total Gain = 1,454.75 + 100 = 1,554.75= 1,554.75/5,277.25\*100 Return on investment = 29.46 % The calculations using Excel were made as follows: BOUGHT Data entry Cell B21: 100 Cell B22: 52.25

Compound Interest Formula

S = Money accrued after n years also called compound amount

- P = Principal
- r = Rate of interest

n = Number of periods

$$S = P(1 + r/100)^{n}$$

Compound interest = S - P

# Example

Calculate compound interest earned on Rs. 750 invested at 12% per annum for 8 years.

 $S = P(1+r/100)^8$ 

 $=750(1+12/100)^{8}$ 

=1857 Rs

Compound interest = 1857 - 750 = 1107 Rs

## LECTURE 7 Applications of Basic Mathematics

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Scope of Module 2
- Review of lecture 6
- Annuity
- Accumulated value
- Accumulation Factor
- Discount Factor
- Discounted value
- Algebraic operations
- Exponents
- Solving Linear equations

### Module 2

Module 2 covers the following lectures:

- Linear Equations (Lectures 7)
- Investments (Lectures 8)
- Matrices (Lecture 9)
- Ratios & Proportions and Index Numbers (Lecture 10)

# <u>Annuity</u>

It some point in your life you may have had to make a series of fixed payments over a period of time - such as rent or car payments - or have received a series of payments over a period of time, such as bond coupons. These are called annuities. Annuities are essentially series of fixed payments required from you or paid to you at a specified frequency over the course of a fixed period of time.

An annuity is a type of investment that can provide a steady stream of income over a long period of time. For this reason, annuities are typically used to build retirement income, although they can also be a tool to save for a child's education, create a trust fund, or provide for a surviving spouse or heirs.

The most common payment frequencies are yearly (once a year), semi-annually (twice a year), quarterly (four times a year) and monthly (once a month).

#### Calculating the Future Value or accumulated value of an Annuity

If you know how much you can invest per period for a certain time period, the future value of an ordinary annuity formula is useful for finding out how much you would have in the future by investing at your given interest rate. If you are making payments on a loan, the future value is useful for determining the total cost of the loan.

Let's now run through Example 1. Consider the following annuity cash flow schedule:

Payment paid or received at end of each period

In order to calculate the future value of the annuity, we have to calculate the future value of each cash flow. Let's assume that you are receiving \$1,000 every year for the next five years, and you invested each payment at 5%. The following diagram shows how much you would have at the end of the five-year period:

Future Value of an Ordinary Annuity = \$5525.64

Since we have to add the future value of each payment, you may have noticed that, if you have an annuity with many cash flows, it would take a long time to calculate all the future values and then add them together. Fortunately, mathematics provides a formula that serves as a short cut for finding the accumulated value of all cash flows received from an annuity:

$$FV_{Ordinary Annuity} = C * \left[ \frac{(1+i)^n - 1}{i} \right]$$

C=Payment per period or amount of annuity i = interest rate n = number of payments

 $((1 + i)^n - 1) / i)$  is called accumulation factor for n periods.

Accumulated value of n period = payment per period × accumulation factor for n periods

If we were to use the above formula for Example 1 above, this is the result:

$$FV_{Ordinary Annuity} = \$1000 * \left[ \frac{(1+0.05)^5 - 1}{0.05} \right]$$
  
=\\$1000\*[5.53]  
=\\$5525.63

Note that the \$0.01 difference between \$5,525.64 and \$5,525.63 is due to a rounding error in the first calculation. Each of the values of the first calculation must be rounded to the nearest penny - the more you have to round numbers in a calculation the more likely rounding errors will occur. So, the above formula not only provides a short-cut to finding FV of an ordinary annuity but also gives a more accurate result.

#### Calculating the Present Value or discounted value of an Annuity

If you would like to determine today's value of a series of future payments, you need to use the formula that calculates the present value of an ordinary annuity.

For Example 2, we'll use the same annuity cash flow schedule as we did in Example 1. To obtain the total discounted value, we need to take the present value of each future payment and, as we did in Example 1, add the cash flows together.

Again, calculating and adding all these values will take a considerable amount of time, especially if we expect many future payments. As such, there is a mathematical shortcut we can use for PV of ordinary annuity.

$$PV_{Ordinary\ Annuity} = C * \left[\frac{1 - (1 + i)^{-n}}{i}\right]$$

C = Cash flow per period i = interest rate

n = number of payments.

(1 - (1 + i) - n)/i is called discount factor for n periods.

Thus Discounted value of n period = payment per period × discount factor for n period The formula provides us with the PV in a few easy steps. Here is the calculation of the annuity represented in the diagram for Example 2:

$$PV_{Ordinary Annuity} = \$1000 * \left[\frac{1 - (1 + 0.05)^{-5}}{0.05}\right]$$
  
= \$1000\*[4.33]  
= \$4329.48

# **NOTATIONS**

The following notations are used in calculations of Annuity:

R = Amount of annuity

N = Number of payments

I = Interest rater per conversion period

S = Accumulated value

A = Discounted or present worth of an annuity

# ACCUMULATED VALUE

The accumulated value S of an annuity is the total payments made including the interest. The formula for Accumulated Value S is as follows:

Accumulation factor for n payments =  $((1 + i)^n - 1) / i$ It may be seen that: Accumulated value = Payment per period x Accumulation factor for n payments

The discounted or present worth of an annuity is the value in today's rupee value. As an example if we deposit 100 rupees and get 110 rupees

(i.e. 10 % interest on 100 Rs. which is 100\*10/100 = 10 Rs. so total amount is 100+10 = 110 or simply 100(1+10/100) = 100(1+0.1) = 100(1.1) = 110)

after one year, the Present Worth or of 110 rupees will be 100. Here 110 will be future value of 100 at the end of year 1.

The amount 110, if invested again, can be Rs. 121 after year 2.

(i.e. 10 % of 110 is 110\*10/100 = 11, so total amount is 110+11 = 121)

The present value of Rs. 121, at the end of year 2, will also be 100.

# DISCOUNT FACTOR AND DISCOUNTED VALUE

When future value is converted into present worth, the rate at which the calculations are made is called Discount factor rate. In the previous example 10% was used to make the calculations. This rate is called Discount Rate. The present worth of future payments is called Discounted Value.

# EXAMPLE 1. ACCUMULATION FACTOR (AF) FOR n PAYMENTS

Calculate Accumulation Factor and Accumulated value when: rate of interest i = 4.25 % Number of periods n = 18 Amount of Annuity R = 10,000 Rs. Accumulation Factor AF =  $((1 + 0.0425)^{18-1})/0.0425 = 26.24$ Accumulated Value S = 10,000x 26.24 = 260,240 Rs

# EXAMPLE 2. DISCOUNTED VALUE (DV)

In the above example calculate the value of all payments at the beginning of term of annuity i-e present value or discounted value. Discount rate = 4.25%Number of periods = 18 Amount of annuity= 10000 Rs Value of all payments at the beginning of term of Annuity or discounted value = Payment per period x Discount Factor (DF) Formula for Discount Factor =  $(1-1/(1+i)^n)/i$ =  $(1-1/(1+0.0425)^{18})/0.0425 = 12.4059$ 

Discounted value =  $10000 \times 12.4059 = 124059$  Rs **EXAMPLE 3. DISCOUNTED VALUE (DV)** How much money deposited now will provide payments of Rs. 2000 at the end of each halfyear for 10 years if interest is 11% compounded six-monthly. Amount of annuity = 2000Rs Rate of interest = i = 11% / 2 = 0.055Number of periods = n =  $10 \times 2 = 20$ DISCOUNTED VALUE =  $2,000 \times ((1-1 / (1+0.055)^{2}0) / 0.055)$ 

# = 2,000 x11.95

=23,900.77

# **ALGEBRAIC OPERATIONS**

Algebraic Expression indicates the mathematical operations to be carried out on a combination of NUMBERS and VARIABLES.

The components of an algebraic expression are separated by Addition and Subtraction. In the expression  $2x^2 - 3x - 1$  the components  $2x^2$ , 3x and 1 are separated by minus "-" sign.

# In algebraic expressions there are four types of terms:

- Monomial, i.e. 1 term (Example: 3x<sup>2</sup>)
- Binomial, i.e. 2 terms (Example:  $3x^2 + xy$ )
- Trinomial, i.e. 3 terms (Example:  $3x^2+xy-6y^2$ )
- Polynomial, i.e. more than 1 term (Binomial and trinomial examples are also polynomial)

Algebraic operations in an expression consist of one or more FACTORs separated by MULTIPLICATION or DIVISION sign.

Multiplication is assumed when two factors are written beside each other. Example:  $xy = x^*y$ Division is assumed when one factor is written under an other.

Example:  $36x^2y / 60xy^2$ 

64

Factors can be further subdivided into NUMERICAL and LITERAL coefficients.

#### There are two steps for Division by a monomial.

- 1. Identify factors in the numerator and denominator
- 2. Cancel factors in the numerator and denominator

# Example:

 $\frac{36x^2y / 60xy^2}{36 \text{ can be factored as } 3 \times 12.}$   $\frac{60}{60 \text{ can be factored as } 5 \times 12$   $x^2y \text{ can be factored as } (x)(x)(y)$   $xy^2 \text{ can be factored as } (x)(y)(y)$ Thus the expression is converted to: 3 x 12

 $3 \times 12(x)(x)(y)/5 \times 12(x)(y)(y)$ 

12x(x)(y) in both numerator and denominator cancel each other. The result is: 3(x)/5(y)

# Another example of division by a monomial is $(48a^2 - 32ab)/8a$ .

Here the steps are:

- 1. Divide each term in the numerator by the denominator
- 2. Cancel factors in the numerator and denominator
  - $48a^2 / 8a = 8x6(a)(a) / 8a = 6(a)$ 32(a)(b) / 8(a) = 4x8(a)(b) / 8(a) = 4(b) The answer is 6(a) - 4(b).

How to multiply polynomials? Look at the example  $-x(2x^2 - 3x - 1)$ . Here each term in the trinomial  $2x^2 - 3x - 1$  is multiplied by -x. =  $(-x)(2x^2) + (-x)(-3x) + (-x)(-1)$ =  $-2x^3 + 3x^2 + x$ 

	Multiplyin	g <i>Poly</i> no	mials
I	Example -x(2	x <sup>2</sup> - 3x - 1)	What is the Expression called?
Multip	ly each term ir	the TRINO	MIAL by $(-x)$
	$= (-x)(2x^2) +$	(-x)(-3x)+	(-x)(-1)
The pn	oduct of two neg	ative quantitie	s is positive.

Please note that product of two negatives is positive.

 $(3x^6y^3/\,x^2z^3)^2$ Exponent of a term means calculating some power of that term. In the example we are required to work out exponent of  $3x^6y^3/\,x^2z^3$  to the power of 2. The steps in this calculation are:

- Simplify inside the brackets first. 1.
- 2. Square each factor

3. Simplify In the first step, the expression  $3x^6y^3 / x^2z^3$  is first simplified to  $(3x^4)(y^3)/z^3$ . In the next step we take squares. The resulting expression is:  $(3^2)(x^{4*2})(y^{3*2})/z^{3*2} =$ 

 $9x^{8}y^{6}/z^{6}$ 

### LINEAR EQUATION

If there is an expression A + 9 = 137, how do we calculate the value of A? A = 137 - 9 = 128

As you see the term 9 was shifted to the right of the equality.

# To solve linear equations:

- 1. Collect like terms
- 2. Divide both sides by numerical coefficient.

Step 1: x = 341.25 + 0.025x x - 0.025x = 341.25 x(1-0.025) = 341.25 0.975x = 341.25Step 2. x = 341.25/0.975 = 350

in one Unknown Solve for x from the following:  $x = 341.25 \pm 0.025 x$ 1 Collect like Terms x = 341.25 + 0.025x ЭÐ -0.025x = 341.251 - 0.025\$.975x = 341.25 Divide both x = 350sides by 0.975 1906

### LECTURE 8 Compound Interest Calculate returns from investments Annuities Excel Functions

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review of lecture 7
- Compound Interest
- Calculate returns from investments
- Annuities
- Excel Functions

# **CUMIPMT**

Returns the cumulative interest paid on a loan between start\_period and end\_period. If this function is not available, and returns the #NAME? error, install and load the Analysis ToolPak add-in. The syntax is as follows:

**CUMIPMT**(rate,nper,pv,start\_period,end\_period,type)

Rate: interest rate. Nper: total number of payment periods Pv: present value. Start\_period: first period in the calculation End\_period: last period in the calculation Type: timing of the payment

Туре	Timing
0 (zero)	Payment at the end of the period
1	Payment at the beginning of the period

# CUMIPMT-EXAMPLE

Following is an example of CUMIPMT function. In this example, in the first case the objective is to find total interest paid in the second year of payments for periods 13 to 24. Please note there are 12 periods per year. The second case is for the first payment period.

In the first formula, the Annual interest rate 9% is cell A2 (not shown here). The Years of the loan are given in cell A3. The Present value is in cell A4. For the Start period the value 13 was entered. For the End period, the value 24 has been specified. The value of Type is 0, which means that the payment will be at the end of the period. Please note that the annual interest is first divided by 12 to arrive at monthly interest. Then the Years of the loan are multiplied by 12 to get total number of months in the Term of the loan. The answer is (-11135.23).

In the second formula, which gives Interest paid in a single payment in the first month 1 was specified as the Start period. For the End period also the value 1 was entered. This is because only 1 period is under study. All other inputs were the same. The answer is (-937.50).

## Data Description

9% Annual interest rate

30 Years of the loan

125,000 Present value

**=CUMIPMT**(A2/12,A3\*12,A4,13,24,0)Total interest paid in the second year of payments, periods 13 through 24 (-11135.23)

**=CUMIPMT** (A2/12,A3\*12,A4,1,1,0)Interest paid in a single payment in the first month (-937.50)

# **CUMPRINC**

The CUMPRINC function returns the cumulative principal paid on a loan between two periods.

The syntax is as under:

**CUMPRINC**(rate,nper,pv,start\_period,end\_period,type)

# Rate: interest rate.

Nper: total number of payment periods.
Pv: present value
Start\_period: period in the calculation. Payment
End\_period: last period in the calculation
Type: timing of the payment (0 or 1 as above)

# **CUMPRINC EXAMPLE**

Following is an example of CUMPRINC function. In this example, in the first case the objective is to find the total principal paid in the second year of payments, periods 13 through 24. Please note there are 12 periods per year. The second case is for the principal paid in a single payment in the first month.

In the first formula, the Interest rate per annum 9% is in cell A2 (not shown here). The Term in years (30) is given in cell A3. The Present value is in cell A4. For the Start period the value 13 was entered. For the End period, the value 24 has been specified. The value of Type is 0, which means that the payment will be at the end of the period. Please note that the interest is first divided by 12 to arrive at monthly interest. Then the years of loan are multiplied by 12 to get total number of months in the term of the loan. The answer is (-934.1071).

In the second formula, which gives the principal paid in a single payment in the first month 1 was specified as the start period. For the end period also the value 1 was entered. This is because only 1 period is under study. All other inputs were the same. The answer is (-68.27827).

# **EXAMPLE**

DataDescription9.00%Interest rate per annum30Term in years125,000Present value=CUMPRINC(A2/12,A3\*12,A4,13,24,0)The total principal paid in the second year ofpayments, periods 13 through 24 (-934.1071)=CUMPRINC(A2/12,A3\*12,A4,1,1,0)The principal paid in a single payment in the firstmonth (-68.27827)

# **EFFECT**

Returns the effective annual interest rate. As you see there are only two inputs, namely, the nominal interest Nominal\_rate and the number of compounding periods per year Npery.

EFFECT(nominal\_rate,npery) Nominal\_rate: nominal interest rate Npery: number of compounding periods per year

# EFFECT-EXAMPLE

Here Nominal\_rate = 5.25% in cell A2. Npery =4 in cell A3. The answer is 0.053543 or 5.3543%. You should round off the value to 2 decimals. 5.35%. 5.25% Nominal interest rate

4 Number of compounding periods

per year

=EFFECT(A2,A3)

Effective interest rate with the terms above (0.053543 or 5.3543 percent)

# <u>FV</u>

Returns the future value of an investment. There are 5 inputs, namely, Rate the interest rate, Nper number of periods, Pmt payment per period, Pv present value and Type. FV(rate,nper,pmt,pv,type) Rate: interest rate per period Nper: total number of payment periods Pmt: payment made each period. Pv: present value, or the lump-sum amount Type: number 0 or 1 due

# FV-EXAMPLE 1

In the formula, there are 5 inputs, namely, Rate 6% in cell A2 as the interest rate, 10 as Nper number of periods in cell A3, -200 (notice the minus sign) as Pmt payment per period in cell A4, -500 (notice the minus sign) as Pv present value in cell A4 and 1 as Type in cell A6. The answer is (2581.40).

- Data Description EXAMPLE 1
- 6% Annual interest rate
- 10 Number of payments
- -200 Amount of the payment
- -500 Present value
- P ayment is due at the beginning of the period.

=FV(A2/12, A3, A4, A5, A6) Future value of an investment with the above terms (2581.40) =FV(rate,nper,pmt,pv,type)

# FV-EXAMPLE 2
In the formula, there are 3 inputs, namely, Rate 12% in cell A2 as the interest rate, 12 as Nper number of periods in cell A3, -1000 (notice the minus sign) as Pmt payment per period in cell A4. Pv present value and Type are not specified. Both are not required as we are calculating the Future value of the investment. The answer is (12682.50).

## EXAMPLE 2

12% Annual interest rate 12 Number of payments -1000 Amount of the payment =FV(A2/12, A3, A4) Future value of an investment with the above terms (12,682.50) FV(rate,nper,pmt,pv,type)

## **FV-EXAMPLE 3**

In the formula, there are 4 inputs, namely, Rate 11% in cell A2 as the interest rate, 35 as Nper number of periods in cell A3, -2000 (notice the minus sign) as Pmt payment per period in cell A4, 1as Type in cell A5. The value of Pv was omitted by entering a blank for the value (note the double commas",,". The answer is (82846.25).

## EXAMPLE 3

- 11% Annual interest rate
- 35 Number of payments
- -2000 Amount of the payment
- Payment is due at the beginning of the period

=FV(A2/12, A3, A4,, A5) Future value of an investment with the above terms (82,846.25)

FV(rate,nper,pmt,pv,type)

## FV SCHEDULE

Returns the future value of an initial principal after applying a series of compound interest rates. FVSCHEDULE(principal, schedule) Principal: present value Schedule: an array of interest rates to apply

## FV SCHEDULE-EXAMPLE

In this example, the Principal is 1. The compound rates {0.09, 0.11,0.1} are given within curly brackets. The answer is (1.33089). FVSCHEDULE(principal,schedule) =FVSCHEDULE(1,{0.09,0.11,0.1}) Future value of 1 with compound interest rates of 0.09,0.11,0.1 (1.33089)

## <u>IPMT</u>

Returns the interest payment for an investment for a given period. IPMT(rate,per,nper,pv,fv,type) Rate: interest rate per period Per: period to find the interest Nper: total number of payment periods Pv: present value, or the lump-sum amount Fv: future value, or a cash balance Type: number 0 or 1

#### <u>ISPMT</u>

Calculates the interest paid during a specific period of an investment ISPMT(rate,per,nper,pv) Rate: interest rate Per: period Nper: total number of payment periods Pv: present value. For a loan, pv is the loan amount

#### NOMINAL

Returns the annual nominal interest rate. NOMINAL(effect\_rate,npery) Effect\_rate: effective interest rate Npery: number of compounding periods per year

## <u>NPER</u>

Returns the number of periods for an investment. NPER(rate, pmt, pv, fv, type) Rate: the interest rate per period. Pmt: payment made each period Pv: present value, or the lump-sum amount Fv: future value, or a cash balance Type: number 0 or 1 (due)

#### <u>NPV</u>

Returns the net present value of an investment based on a series of periodic cash flows and a discount rate. Its syntax is NPV(rate,value1,value2,...)

Rate: is the rate of discount over the length of one period.

Valu1,value2,... are 1 to 29 arguments representing the payments and income.

## <u>PMT</u>

Returns the periodic payment for an annuity. PMT(rate,nper,pv,fv,type) Rate: interest rate Nper: total number of payments Pv: present value Fv: future value Type: number 0 (zero) or 1

## <u>PPMT</u>

Returns the payment on the principal for an investment for a given period. PPMT(rate,per,nper,pv,fv,type) Rate: interest rate per period. Per: period and must be in the range 1 to nper Nper: total number of payment periods Pv: the present value Fv: future value (0) Type: the number 0 or 1 (due)

## <u>PV</u>

Returns the present value of an investment. PV(rate,nper,pmt,fv,type) Rate: interest rate per period Nper: total number of payment periods in an annuity Pmt: payment made each period and cannot change over the life of the annuity Fv: future value, or a cash balance Type: number 0 or 1 and indicates when payments are due

## <u>RATE</u>

Returns the interest rate per period of an annuity. RATE(nper,pmt,pv,fv,type,guess) Nper: total number of payment periods Pmt: payment made each period Pv: present value Fv: future value, or a cash balance (0) Type: number 0 or 1 (due) Guess: (10%)

## RATE-EXAMPLE

Three inputs are specified. 4 as years of loan in cell A5, -200 as monthly payment in cell A6 and 8000 as amount of loan in cell A7. The answer is 0.09241767 or 9.24%.

#### LECTURE 9 Matrix and its dimension Types of matrix

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 8
- Matrices

## QUESTIONS

Every student wonders why he or she should study matrices. There are manty important questions:

Where can we use Matrices? Typical applications? What is a Matrix? What are Matrix operations? Excel Matrix Functions? There are many applications of matrices in business and industry especially where large

amounts of data are processed daily.

## **TYPICAL APPLICATIONS**

Practical questions in modern business and economic management can be answered with the help of matrix representation in:

- Econometrics
- Network Analysis
- Decision Networks
- Optimization
- Linear Programming
- Analysis of data
- Computer graphics

## WHAT IS A MATRIX?

A Matrix is a rectangular array of numbers. The plural of matrix is matrices. Matrices are usually represented with capital letters such as Matrix A, B, C. For example

Ги	о <b>л</b>	г	47	<u></u>	70	60 T		1	-4	
A =   -	9	B=	47	62	70	56	C=	n	З	
<sup>-</sup>  -3	4		52	33	28	45	Ň		5	
-	_	-						5	-2	l

The numbers in a matrix are often arranged in a meaningful way. For example, the order for school clothing in September is illustrated in the table, as well as in the corresponding matrix.

	Size							
	Youth	S	М	L	XL			
Sweat Pants	0	10	34	40	12			
Sweat Shirts	18	25	29	21	7			
Shorts T-shirts	19 27	13 7	48 10	36 24	9 14			

The data in the above table can be entered in the shape of a matrix as follows:

Γο	10	34	40	12]	
18	25	29	21	7	
19	13	48	36	9	
27	7	10	24	14	

## DIMENSION

Dimension or Order of a Matrix = Number of Rows x Number of Columns **Example** 

Matrix T has dimensions of 2x3 or the order of matrix T is 2x3. '×' is just the notation, it do not mean to multiply both of them.

$$T = \begin{bmatrix} 6 & 2 & -1 \\ -4 & 0 & 7 \end{bmatrix} \leftarrow row1$$
$$\land \uparrow \land$$
$$col1 \ col2 \ col3$$

## ROW, COLUMN AND SQUARE MATRIX

Suppose n = 1, 2, 3, 4, ...

A matrix with dimensions 1xn is referred to as a row matrix For example, matrix A is a 1x4 **row matrix**. A matrix with dimensions nx1 is referred to as a column matrix. For example, matrix B in the middle is a 2x1 **column matrix**. A matrix with dimensions nxn is referred to as a square matrix.

For example, matrix C is a 3x3 square matrix.

$$A = \begin{bmatrix} 12 & 17 & 10 & 9 \end{bmatrix} B = \begin{bmatrix} -2 \\ 0 \end{bmatrix} C = \begin{bmatrix} 2 & -3 & 7 \\ 6 & 8 & -1 \\ -5 & 0 & 4 \end{bmatrix}$$

## **IDENTITY MATRIX**

An identity matrix is a square matrix with 1's on the main diagonal from the upper left to the lower right and 0's off the main diagonal. An identity matrix is denoted as I. Some examples of identity matrices are shown below. The subscript indicates the size of the

identity matrix. For example,  $I_{\pi}$ , represents an identity matrix with dimensions n×n.

						[1	0	0	0]	
		[1	0	0	,	0	1	0	0	
, [1	07	$I_3 = 0$	1	0	1 <sub>4</sub> =	0	0	1	0	
$I_2 = \begin{bmatrix} 0 \end{bmatrix}$	1	Lo	0	1_		lo	0	0	1	

## **MULTIPLICATIVE IDENTITY**

With real numbers, the number 1 is referred to as a multiplicative identity because it has the unique property that the product a real number and 1 is that real number. In other words, 1 is called a multiplicative identity because for any real number n,  $1^n$  n = n and n<sup>o</sup> 1=n. With matrices, the identity matrix shares the same

unique property as the number 1. In other words, a 2×2 identity matrix is a multiplicative inverse because for any 2×2 matrix A,  $I_2 \cdot A = A$  and  $A \cdot I_2 = A$ Example

Given the 2×2 matrix, A = 
$$\begin{bmatrix} 2 & -1 \\ -3 & 4 \end{bmatrix}$$
  
 $I_2 \cdot A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 2 & -1 \\ -3 & 4 \end{bmatrix} = \begin{bmatrix} 2 & -1 \\ -3 & 4 \end{bmatrix}$   
 $\begin{bmatrix} 2 & -1 \\ -3 & 4 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 2 & -1 \\ -3 & 4 \end{bmatrix}$   
Work  
r1c1 = 1(2) + 0(-3) = 2  
r2c1 = 0(2) + 1(-3) = -3  
r1c1 = 2(1) + -1(0) = 2  
r2c1 = -3(1) + 4(0) = -3  
r1c2 = 1(-1) + 0(4) = -1  
r2c2 = 0(-1) + 1(4) = 4  
r1c2 = 2(0) + -1(1) = -1  
r2c2 = -3(0) + 4(1) = 4

where 'r' is for row and 'c' is for column.

#### LECTURE 10 MATRICES

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 9
- Matrices

## EXAMPLE 1

An athletic clothing company manufactures T-shirts and sweat shirts in four differents sizes, small, medium, large, and x-large. The company supplies two major universities, the U of R and the U of S. The tables below show September's clothing order for each university

University of S's September Clothing Order

	S	М	L	XL
T-shirts	100	300	500	300
sweat shirts	150	400	450	250

## University of R's September Clothing Order.

	S	М	L	XL
T-shirts	60	250	400	250
sweat shirts	100	200	350	200

## Matrix Representation

The above information can be given by two matrices S and R as shown below.

	[100	300	500	300]
S =	150	400	450	250

	60	250	400	250]
R =	100	200	350	220

#### MATRIX OPERATIONS

The matrix operations can be summarized as under:

- Organize and interpret data using matrices
- Use matrices in business applications
- Add and subtract two matrices
- Multiply a matrix by a scalar
- Multiply two matrices
- Interpret the meaning of the elements within a product matrix

VU

## PRODUCTION

The clothing company production in preparation for the universities' September orders is shown by the table and corresponding matrix P below.

	S	М	L	XL
T-shirts	300	700	900	500
sweat shirts	300	700	900	500

300 700 900 500 300 700 900 500

#### ADDITION AND SUBTRACTION OF MATRICES

The sum or difference of two matrices is calculated by adding or subtracting the corresponding elements of the matrices.

To add or subtract matrices, they must have the same dimensions.

#### PRODUCTION REQUIREMENT

Since the U of S ordered 100 small T-shirts and the U of R ordered 60, then altogether 160 small T-shirts are required to supply both universities. Thus, to calculate the total number of T-shirts and sweat shirts required to supply both universities, add the corresponding elements of the two order matrices as shown below.

	<b>[</b> 100	300	500	300]	<b>[</b> 60	250	400	250]
	150	400	450	250	100	200	350	220
<b>[</b> 160	550	900	550]	-				
_250	600	800	470					

## OVERPRODUCTION

Since the company produced 300 small T-shirts and the received orders for only 160 small T-shirts, then the company produced 140 small T-shirts too many. Thus, to determine the company's over-production, subtract the corresponding elements of the total order matrix from the production matrix as shown below.

[300	700	900	500]	[160	550	900	550]	[140	150	0	-50]
300	700	900	500	250	600	800	470	_ 50	100	100	30

## MULTIPLY A MATRIX BY A SCALAR

Given a matrix A and a number c, the scalar multiplication cA is computed by multiplying the scalar c by every element of A. For example:

$$2\begin{bmatrix} 1 & 8 & -3\\ 4 & -2 & 5 \end{bmatrix} = \begin{bmatrix} 2 \times 1 & 2 \times 8 & 2 \times -3\\ 2 \times 4 & 2 \times -2 & 2 \times 5 \end{bmatrix} = \begin{bmatrix} 2 & 16 & -6\\ 8 & -4 & 10 \end{bmatrix}$$

## **MULTIPLICATION OF MATRICES**

# To understand the reasoning behind the definition of matrix multiplication, let us consider the following example.

Competing Companies, A and B, sell juice in 591 mL, 1 L and 2 L plastic bottles at prices of Rs.1.60, Rs.2.30 and Rs.3.10, respectively. The table below summarizes the sales for the two companies during the month of July.

	591mL	1L	2L
Company A	20,000	5,500	10,600
Company B	18,250	7,000	11,000

What is total revenue of Company A? What is total revenue of Company B? Matrices may be used to illustrate the above information. As shown at the right, the sales can be written as a 2X3 matrix, S, the selling prices can be written as a column matrix, P, and the total revenue for each company can be expressed as a column matrix, R.

Since revenue is calculated by multiplying the number of sales by the selling price, the total revenue for each company is found by taking the product of the sales matrix and the price matrix.

20,000	5, 500	10,600]	1.60		[77,510]
18,250	7,000	11,000 ] <sup>×</sup>	2.30 3.10	=	79,400

Consider how the first row of matrix S and the single column P lead to the first entry of R.

20,000	5, 500	$10,600 \times 2.30$	⇒20,000(1.60) ↓	+5,500(2.30)+ ↓	10,600(3.10) ⇒ ↓	[77,510]
[18,250	7,000	<sup>11,000</sup> [3.10]	Product of	Product of	Product of	[79,400]
			First Entries	Second Entries	Third Entries	

With the above in mind, we define the product of a row and a column to be the number obtained by multiplying corresponding entries (first by first, second by second, and so on) and adding the results.

## MULTIPLICATION RULES

If matrix A is a  $m^{\times}n$  matrix and matrix B is a  $n^{\times}p$  matrix, then the product AB is the  $m^{\times}p$  matrix whose entry in the i-th row and the j-th column is the product of the i-th row of matrix A and the j-th row of matrix B.

The product of a row and a column is the number obtained by multiplying corresponding elements (first by first, second by second, and so on).

To multiply matrices, the number of columns of A must equal the number of rows of B.

## For example

Given the matrices below, decide if the indicated product exists. And, if the product exists, determine the dimensions of the product matrix.

 $A = \begin{bmatrix} -5 & 0 & 4 \\ 12 & -3 & 10 \\ 7 & 15 & -1 \end{bmatrix}$  $B = \begin{bmatrix} 1 & 4 \\ 9 & -1 \\ -5 & 7 \end{bmatrix}$ 

#### **MULTIPLICATION CHECKS**

The table below gives a summary whether it is possible to multiply two matrices. It may be noticed that the product of matrix A and matrix B is possible as the number of columns of A are equal to the number of rows of B. The product BA is not possible as the number of columns of b are not equal to rows of A.

Product	Dimensions of the Matrices	Does a product exist? (Is it possible to multiply the given matrices in this order?)	Dimensions of Product Matrix
AB	$A = 3 \times 3 \qquad B = 3 \times 2$ $\uparrow \qquad \uparrow$ inner dimensions	Yes, the product exists since the inner dimensions match (# of columns of <i>A</i> = # of rows of <i>B</i> ).	3 <sup>×</sup> 2
BA	$B = 3 \times 2 \qquad A = 3 \times 3$ $\uparrow \qquad \uparrow$ inner dimensions	No, the product does not exist since the inner dimensions do not match (# of columns of <i>B</i> ≠ # of rows of <i>A</i> ).	n/a

## **MULTIPLICATIVE INVERSES**

#### Real Numbers

Two non-zero real numbers are multiplicative inverses of each other if their products, in both orders, is 1. Thus, 1 1 1

the multiplicative inverse of a real number, x is x or  $x^{-1}$  since x • x = 1 and x • x = 1.

1

## Example:

The multiplicative inverse of 5 is  $5^{-1}$  since

$$\frac{1}{5 \cdot 5} = 1 \text{ and } \frac{1}{5 \cdot 5} = 1$$

<u>Matrices</u> Two 2<sup>×2</sup> matrices are inverses of each other if their products, in both orders, is a 2<sup>×2</sup>  $\frac{1}{4^{-1}}$ identity matrix. Thus, the multiplicative inverse of a 2  $^{\times}$  2 matrix, A is  $\mathit{A}^{-1}$  since A \*  $\mathit{A}^{-1}$ =  $I_2$  and  $A^{-1} \cdot A = I_2$ 

## Example:

The multiplicative inverse of a matrix,

$$\begin{bmatrix} 2 & 1 \\ 5 & 3 \end{bmatrix}$$
is 
$$\begin{bmatrix} 3 & -1 \\ -5 & 2 \end{bmatrix}$$

2	1][	3	-1		1	0
_5	3][-	-5	2	=	0	1
3	-1	][2	1		1	0
-5	2	5	3	_	0	1

VU

#### LECTURE 11 MATRICES

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 10
- Matrix functions in Excel
- Set up and manipulate ratios.
- Allocate an amount on a prorata basis using proportions.

## MATRIX FUNCTIONS IN MS EXCEL

The Matrix Functions in Microsoft Excel are as follows:

- 1. MINVERSE
- 2. MDETERM
- 3. MMULT

## **MINVERSE**

Returns the inverse matrix for the matrix stored in an array.

## Syntax

## MINVERSE(array)

**array** is a numeric array with an equal number of rows and columns. **Remarks** 

- Array can be given as a cell range, such as A1:C3; as an array constant, such as {1,2,3;4,5,6;7,8,9}; or as a name for either of these.
- If any cells in array are empty or contain text, MINVERSE returns the #VALUE! error value.
- MINVERSE also returns the #VALUE! error value if array does not have an equal number of rows and columns.
- Formulas that return arrays must be entered as array formulas.
- Inverse matrices, like determinants, are generally used for solving systems of mathematical equations involving several variables. The product of a matrix and its inverse is the identity matrix the square array in which the diagonal values equal 1, and all other values equal 0.
- As an example of how a two-row, two-column matrix is calculated, suppose that the range A1:B2 contains the letters a, b, c, and d that represent any four numbers. The following table shows the inverse of the matrix A1:B2.

	Column A	Column B
Row 1	d/(a*d-b*c)	b/(b*c-a*d)
Row 2	c/(b*c-a*d)	a/(a*d-b*c)

- MINVERSE is calculated with an accuracy of approximately 16 digits, which may lead to a small numeric error when the cancellation is not complete.
- Some square matrices cannot be inverted and will return the #NUM! error value with MINVERSE. The determinant for a noninvertable matrix is 0.

## MINVERSE

	MINVERSE (arra	ay)							
Array isa nu	meric array with of rows and col	an equal number umns							
Inve	rse of the matrix	KA1:B2.							
	Column A	Column B							
Row 1	d/(a*d-b*c)	b/(b*c-a*d)							
Row2	c/(b*c-a*d)	a/(a*d-b*c)							
	Array formula	a							
	1. F2								
	2. Enter formu	lla							
3	3. Ctrl + Shift + Enter								

#### **MINVERSE-EXAMPLE**

Find the inversion or multiplicative inverse of following matrix

$$\begin{bmatrix} 4 & -1 \\ 2 & 0 \end{bmatrix}$$

The excel formula in the example must be entered as an array formula. Otherwise a single result, 0, will appear.

#### Please note that formulas that return arrays must be entered as array formulas.

The steps of finding multiplicative inverse of above matrix is as follows:

- 1. Enter data of array to be inverted, in Cells A4:B5. (i-e in cells A4, B4, A5, B5)
- 2. Click on cell A6.
- 3. Keeping left mouse button pressed, drag it to cell B7.Four cells A6, B6, A7, B7 will be selected.
- 4. Press F2 from your keyboard. (Key F2 is selected to enter Edit Mode in the active cell. It's a keyboard shortcut. Even if you don't press F2, you can write the formula).
- 5. Type the formula =MINVERSE(A4:B5). This will appear in cell A6.
- 6. Press Ctrl, Shift, Enter keys simultaneously from your keyboard.
- 7. Multiplicative inverse of the matrix will appear in cells A6, A7, B6, B7.

Now click any cell among A6:B7, in the formula bar you can see curly brackets round the formula. That is, {=MINVERSE(A4:B5)}. This shows that you have gone through the right procedure of entering array formula.

## <u>MDETERM</u>

Returns the matrix determinant of an array.

#### Syntax

#### MDETERM(array)

array is a numeric array with an equal number of rows and columns. Remarks

- Array can be given as a cell range, for example, A1:C3; as an array constant, such as {1,2,3;4,5,6;7,8,9}; or as a name to either of these.
- If any cells in array are empty or contain text, MDETERM returns the #VALUE! error value.
- MDETERM also returns #VALUE! if array does not have an equal number of rows and columns.
- The matrix determinant is a number derived from the values in array. For a threerow, three-column array, A1:C3, the determinant is defined as:

## MDETERM(A1:C3) = A1\*(B2\*C3-B3\*C2) + A2\*(B3\*C1-B1\*C3) + A3\*(B1\*C2-B2\*C1)

- Matrix determinants are generally used for solving systems of mathematical equations that involve several variables.
- MDETERM is calculated with an accuracy of approximately 16 digits, which may lead to a small numeric error when the calculation is not complete. For example, the determinant of a singular matrix may differ from zero by 1E-16.

#### **MDETERM-EXAMPLE**

The example shows an array of dimension 4 x 4 in cell range A14:D17. The formula was entered in cell A18. The result of this calculation is 88.

<b>N 1</b>	Microsoft Excel - Book1

13	Data	Data	Data	Data						
14	1	3	8	5						
15	1	3	6	1						
16	1	1	1	0						
17	7	3	10	2						
18	=MDETER	M( <mark>A14:</mark>	<b>D17</b> )							
19	Determina	nt of th	e matri	ix abov	e (88	)				

There are other ways also for using this function. For example you can enter the matrix as an array constant.

=MDETERM({3,6,1;1,1,0;3,10,2})

Determinant of the matrix as an array constant (1)

You can calculate the determinant of the matrix in the array constant.

=MDETERM({3,6;1,1})	Determinant of the matrix in the array
	constant (-3)

Unequal number of rows and columns results in an error.

=MDETERM({1,3,8,5;1,3,6,1})	Returns an error because the array
	does not have an equal number of rows
	and columns (#VALUE!)

## <u>MMULT</u>

Returns the matrix product of two arrays. The result is an array with the same number of rows as array1 and the same number of columns as array2. Syntax MMULT(array1,array2) Array1, array2 are the arrays you want to multiply. <u>Remarks</u>

- The number of columns in array1 must be the same as the number of rows in array2, and both arrays must contain only numbers.
- Array1 and array2 can be given as cell ranges, array constants, or references.
- If any cells are empty or contain text, or if the number of columns in array1 is different from the number of rows in array2, MMULT returns the #VALUE! error value.
- The matrix product array a of two arrays b and c is:

$$a_{jj} = \sum_{k=1}^{n} b_{jk} c_{kj}$$

where i is the row number, and j is the column number.

Formulas that return arrays must be entered as array formulas.

## MMULT-EXAMPLE

Let

$$A = \begin{bmatrix} 1 & 3 \\ 7 & 2 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix}. Find AB$$

To find the product AB, follow these steps.

1. Enter array1 in cell range A25:B26. and array2 in cell range D25:E26.

🐱 Microsoft Excel - Book1

31								

- 2. Find the dimension of AB matrix. Here as A and B are 2×2 matrices so AB is also a 2×2 matrix.
- 3. Click on cell A29.
- 4. Keeping left mouse button pressed, drag it to cell B30.Four cells A29, B29, A30, B30 will be selected.
- 5. Press F2 from your keyboard. (Key **F2** is selected to enter Edit Mode in the active cell. It's a keyboard shortcut. Even if you don't press F2, you can write the formula).
- 6. Type the formula =MMULT(

7. Select array1.

8. Put comma.

9. Select array2.

VU

- 10. Close bracket
- 11. Press Ctrl, Shift, Enter keys simultaneously from your keyboard.
- 12. Product AB will appear in cells A29, A30, B29, B30.

## Ŧ

## <u>RATIO</u>

A Ratio is a comparison between things. If in a room there are 30 men and 15 women then the ratio of men to women is 2 to 1. This is written as 2:1 and read as "two is to one". ":" is the notation for a ratio. Be careful, order matters. A ratio of 2:1 is not the same as 1:2. In the form of fraction, we can write 2:1 as 2/1.

The method of calculating ratios is as under:

- 1. Find the minimum value
- 2. Divide all the values by the smallest value.

In the above example, the smallest value was 15. Division gives 30/15 = 2 for men and 15/15 = 1 for women. The ratio is therefore 2:1 for men and women.

## RATIO-EXAMPLE

Three friends Ali, Fawad and Tanveer are doing business together. To set up the business Ali invested Rs. 7800, Fawad Rs. 5,200 and Tanveer Rs. 6,500 What is the ratio of their investments. As discussed above the smallest value is 5200Rs. All values are divided by 5200. The results are 1.5 for Ali, 1 for Fawad and 1.25 for Tanveer. The answer is: 1.5 : 1 : 1.25.

55											
56				RATIO							
57	Ali	7800		1.5							
58	Fawad	5200		1							
59	Tanveer	6500	=	B59/B5	8						
60				1.25							
61											

This example can be solved in Excel. The formula is as under:

Cell D57: =B57 / B58 Cell D58: =B58 / B58 Cell D59: =B59 / B58

The result for cell D59 is shown in cell D60, because the cell D59 is used to display the formula.

## PROPORTION

A proportion is an equation with a ratio on each side. It is a statement that two ratios are equal.

3:4 = 6:8 OR 3/4 = 6/8 is an example of a proportion.

When one of the four numbers in a proportion is unknown, cross products may be used to find the unknown number. This is called solving the proportion or **ESTIMATING USING RATIO**.

## EXAMPLE

Ratio of sales of Product X to sales of Product Y is 4:3. The sales of product X is forecasted at Rs. 180,000. What should be the Sales of product Y to maintain the ratio of sales between the two products.

## CALCULATION

Ratio sales X : Y = 4 : 3 Insert the value for forecasted sale for X. 180,000 : Y = 4 : 3 It can be rewritten as: 180,000/Y = 4/3

## **Calculations using EXCEL**

In cells B70 and B71 the ratios of Product X and Y were entered. The value of forecast of product X was entered in cell D70. Before writing down the formula in excel, it was derived as follows: 1 Ratio of X = (cell B70)

- 2 Ratio of y = (cell B71)
- 3 Sale of  $\vec{X}$  = (cell D70)
- 4 Sale of Y = (cell D71)

Now Ratio X: Y = (cell B70)/ (cell B71)

Ratio of sales = (cell D70)/ (cell D71)

Cross-multiply.

(cell B70) x (cell D71) = (cell B71) x (cell D70)

Cell D71 is unknown. Hence:

(cell D71) = (cell B71) x (cell D70)/ (cell B70)

(cell D71) = (cell B71)/ (cell B70) \* (cell D70)

Thus the formula was:

=B71/B70\*D70

Please note that actually we are using the ratio Y to X as it is easier to think of ratio of unknown to the known.

## ESTIMATING USING RATIO-EXAMPLE 2

In a 500 bed hospital there are 200 nurses and 150 other staff. If the hospital extends by a new wing for 100 beds, then what additional staff is needed?

Let 500 beds  $B_1$  and 100 beds  $B_2$ . Staff nurses  $N_1$  is 200 and other staff  $O_1$  is 150. What is the value of  $N_2$  and  $O_2$  for  $B_2$ . Obviously the

ratio of beds will be used. As pointed out above, think of the ratio of unknown to known. In other words ratio  $B_2:B_1$  or  $B_2/B_1$ . Ratio of nurses would be  $N_2/N_1$ . Ratio of other staff would be  $O_2/O_1$ . Now :

 $N_2/N_1 = B_2/B_1$  Or  $N_2 = (B_2/B_1)^*N_1$  or  $N_2 = (100/500)^*200 = 40$  Nurses  $O_2/O_1 = B_2/B_1$  Or  $N_2 = (B_2/B_1)^*O_1$  or  $O_2 = (100/500)^*150 = 30$  other staff.

## **Calculation**

Beds	:	Nurses	:	Other staff
500	:	200	:	150
100	:	Χ?	:	Y?
Nurses				
500 : 200	= 10	0 : X		
500 X = 2	00 x	100		
X = (200 >	c 100	)/500 = 4	40	
Other sta	ff	,		
Y = (150 >	c 100	0)/500 = 3	30	

#### Calculation using EXCEL

The calculation using EXCEL was done in a similar fashion as the previous example.

The calculation is self-explanatory.

## ESTIMATING USING RATIO-EXAMPLE 3

A Fruit Punch recipe requires mango juice, apple juice and orange juice in the ratio of 3:2:1. To make 2 liters of punch calculate quantity of other ingredients Again we shall use the ratio of unknown to the unknown. The unknowns are mango and apple juice. Consider first ratio of required mango juice (3) to total quantity of punch (6). This was calculated from 3+2+1. Now the quantity of

required mango for 2 liter would simply be (3/6)\*2. Similarly the required quantity of apple juice is (2/6)\*2.

CalculationMango juice : Apple juice : Orange juice3 :2 :3 :2 :Total = 6X? :Y? :Total = 2 litreMango juice (X) = (3 / 6) \* 2 = 1 litreApple juice (Y) = (2 / 6) \* 2 = 0.67 litreOrange juice (Z) = (1 / 6) \* 2 = 0.33 liter

## Calculation using EXCEL

Here also the similar ratios were used. Mango = B20/B23\*D23 Apple = B21/B23\*D23 Orange = B22/B23\*D23

## LECTURE 12 RATIO AND PROPORTION MERCHANDISING

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Module 3
- Review Lecture 11
- Ratio and Proportions
- Merchandising
- Assignment 1A and 1B

## MODULE 3

Module 3 has the following content:

- Ratio and Proportions
- Merchandising
   (Lectures 12)
- Mathematics of Merchandising (Lectures 13-16)

#### ESTIMATING USING RATIOS-EXAMPLE 1

In the previous lecture, we studied how ratios can be used to determine unknowns. Here is another example with a slightly different approach. Here, ratios between the quantities.and data of only one quantity is known. We will estimate the total quantity that can be made? It is the quantity of orange juice that will determine the total quantity that can be made. Again the method is to use the ratio of the unknown to the known.

#### Punch recipe

In a punch the ratio of mango juice, apple juice and orange juice is 3:2:1. If you have 1.5 liters of orange juice, how much punch can you make?

#### **Calculation**

Mango juice : Apple juice : Orange juice

3 2 : : 1 Total = 3+2+1 = 6X (say) : Y(say) : Z(say) ? ? 1.5litres : : Total = ? litre Mango juice (X) =  $(3/1) \times 1.5 = 4.5$  litre Apple juice (Y) =  $(2/1) \times 1.5 = 3.0$  litre Orange juice (Z) = 1.5 litre Punch = 4.5 + 3.0 + 1.5 = 9 litres

## EXCEL Calculation

The method used is the same as in previous examples.

VU

#### ESTIMATING USING RATIOS-EXAMPLE 2

In a punch ratio of mango juice, apple juice and orange juice is 3 : 2 : 1.5. If you have 500 litres of orange juice find how much mango and apple juices are required to make the punch.

#### Punch recipe

The ratio of mango juice, apple juice and orange juice is 3 : 2 : 1.5 If you have 500 milliliters of orange juice, how much mango juice and apple juice is needed? Mango juice : Apple juice : Orange juice

2 : 1.5 3 : Total = 6.5 X (say) : Y(say) : Z (say) 500 litres ? : ? : Total = ? litres Mango juice (X) = (3/1.5)\*500 = 1000 litre Apple juice (Y) = (2/1.5)\*500 = 667 litre Orange juice (Z) = 500 litre Punch = 1000 + 667 + 500 = 2167 litre

#### EXCEL Calculation Here also ratios were used. Mango juice = B45/B47\*D47 Apple juice = B46/B47\*D47 Orange juice = D47

## EXAMPLE

In a certain class, the ratio of passing grades to failing grades is 7 to 5. How many of the 36 students failed the course?

The ratio, "7 to 5" (or 7 : 5 or 7/5), tells you that, of every 7 + 5 = 12 students, five failed. That is, 5/12 of the class failed.

Then (5/12)(36) = 15 students failed.

## PROPORTION

a/b = c/d

...the values in the "b" and "c" positions are called the "means" of the proportion, while the values in the "a" and "d" positions are called the "extremes" of the proportion. A basic defining property of a proportion is that the product of the means is equal to the product of the extremes. In other words, given:

a/b = c/d

...it is a fact that ad = bc. **PROPORTION-EXAMPLES** Is 24/140 proportional to 30/176? **Check:** 140×30 = 4200 24×176 = 4224 So the answer is that given ratios are not proportional. **PROPORTION EXAMPLE 1** Find the unknown value in the proportion: 2: x = 3:9. 2: x = 3:9First, convert the colon-notation ratios to fractions: 2/x = 3/9Cross multiply 18 = 3x6 = x

## **PROPORTION EXAMPLE 2**

Find the unknown value in the proportion: (2x + 1) : 2 = (x + 2) : 5(2x + 1) : 2 = (x + 2) : 5 First, convert the colon-notation ratios to fractions: (2x + 1)/2 = (x + 2)/5 Then solve: 5(2x + 1) = 2(x + 2) 10x + 5 = 2x + 4 8x = -1 x = -1/8

## MERCHANDISING

What does merchandising cover?

- Understand the ordinary dating notation for the terms of payment of an invoice.
- Solve merchandise pricing problems involving mark ups and markdowns.
- Calculate the net price of an item after single or multiple trade discounts.
- Calculate a single discount rate that is equivalent to a series of multiple discounts.
- Calculate the amount of the cash discount for which a payment qualifies.

## STAKEHOLDERS IN Merchandising

Who are the stakeholders in merchandising?

The main players are:

- Manufacturer
- Middleman
- Retailer
- Consumer

There are discounts at all levels in the above chain.

## **MIDDLEMAN**

A middle man is a person who buys a product directly from the manufacturer, and then either sells the product at retail prices to the public, or sells the product at wholesale prices to a distributor. There can often be more than one middle man when the latter practice is adopted. A middle man can purchase from the manufacturer and then work with another middle man who buys for the distributor. The manufacturer often views the middle man as the alternative to direct distribution.

## List price or Retail price

List price refers to the manufacturer's suggested retail pricing. It may or may not be the price asked of the consumer. Much depends on

- 1. the product itself,
- 2. the built-in profit margin,
- 3. Supply and demand.

A product that is in high demand with low availability will sometimes sell *higher* than the list price, though this is less common than the reverse.

Virtually all products have a suggested retail or list price. Resellers (middleman, retailer) buy products in bulk and get a substantial discount in order to be able to get profit from selling the product at or below list price.

VU

## **Trade Discount**

Let L is the list price, then amount of trade discount is some percentage of this price. List price less amount of discount is the net price. In mathematical terms, we can write:

Amount of discount =  $d \times L$ Where, d = Percentage of Discount L = List Price Net Price = L - Ld = L(1 - d) Net Price = List Price - Amount of Discount

## LECTURE 13 MATHEMATICS OF MERCHANDISING

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 12
- Solve merchandising pricing problems involving markup and markdown

## MARKUP

Markup is an amount added to a cost price while calculating a selling price. Especially, an amount that takes into account of overhead and profit. Markup can be expressed as:

- 1. Percentage of cost.
- 2. Percentage of sale.
- 3. Rs Markup

## Markup as Percentage of Cost (MUC):

Here markup is some percentage of cost price. For simplicity, it is also named as **%Markup on cost**. The relation between %markup on cost, cost price and selling price is:

Selling Price = Cost price + (Cost price × %Markup on cost) = Cost price (1 + %Markup on cost)

## Markup as Percentage of Sale price (MUS):

Here markup is some percentage of selling price. For simplicity, it is also named as **%Markup on sale.** The relation between %markup on sale, cost price and selling price is:

Selling Price = Cost price + (Selling price × %Markup on sale)

Cost price = Selling price – (Selling price × %Markup on sale) = Selling price (1 – %Markup on sale)

## Rs Markup:

Markup in terms of rupees is called Rs markup. The relations between Rs markup, cost price and selling price are:

- 1. Selling Price = Cost price + Rs Markup
- 2. Rs Markup = %Markup on cost × Cost price
- 3. Rs Markup = %Markup on sale × Selling price

Any of the above formula can be used to find Rs Markup.

For example:

The cost price of certain item is 80Rs and its selling price is 100Rs. Then Rs Markup = Selling price – Cost price

= 100 – 80 = 20 Rs

**<u>Remember</u>**: If some percentage is given as markup, without mentioning that whether it is markup on cost or markup on sale, it is evident that %markup on cost is under consideration

## EAMPLE 1

A golf shop pays its wholesaler 2,400Rs. for a certain club, and then sells it for 4,500Rs. What is the markup rate?

## Calculation of Markup

Cost price = 2400Rs Selling price = 4500Rs

Selling Price = Cost price + (Cost price × %Markup on cost) %Markup on cost = <u>Selling price – Cost price</u> ×100% Cost price

Since

Rs Markup = Selling Price - Cost price %Markup on cost = <u>Rs markup</u> ×100%

Cost price

1. First, calculate Rs markup : Rs markup = 4500 – 2400 = 2100Rs Then %markup on cost %Markup on cost = <u>Rs markup</u>×100% Cost price

> =  $2100/2400 \times 100\%$  = 87.5%Remember to convert this fraction value to a percent. The markup rate is 87.5%.

## **Calculation using EXCEL**

Enter whole-sale price 2400 in cell B5 Enter sale price 4500 in cell B6 Enter formula for Rs. Markup =B6-B5 in cell B7and press enter. The answer is 2100. Enter formula for % markup =B7/B5\*100 in cell B8 and press Enter. The answer is 87.5% shown in cell B9.

## MARKUP-EXAMPLE 2

A computer software retailer used a markup rate of 40%. Find the selling price of a computer game that cost the retailer Rs. 1,500.

#### <u>Markup</u>

The markup is 40% on the cost, so as Rs Markup = %Markup on cost × Cost price

Rs Markup = (0.40) (1,500) = Rs. 600

#### Selling Price

Then the selling price, being the cost plus markup, that is: Selling Price = Cost price + Rs Markup =1,500 + 600 = Rs. 2,100 The item sold for Rs. 2,100.

## Calculation using EXCEL

Here we use the following formula to show an alternate method of solving the above problem.

Selling Price = Cost price (1 + %Markup on cost)

Enter whole-sale price 1500 in cell B17.

Enter % Markup in cell B18.

Enter formula =(1+B18/100)\*B17 in cell B19. Here the term 1+B18/100 is the **multiplication factor**. B18/100 is the %markup in fraction. The answer 2100 is shown in cell B20.

We could have calculated the multiplication factor separately. But as you see it is not necessary as the entire calculation can be done in one line.

## MARKDOWN

Markdown means a reduction from the original sale price to

- 1. stimulate demand or
- 2. take advantage of reduced costs or
- 3. force competitors out of the market.

Markdown can be expressed as

- Percentage of current selling price
- Rs markdown

#### Markdown as Percentage of current selling price

Here markdown is some percentage of current selling price. For simplicity, it is also named as percent markdown (%markdown). The relation between current selling price, %markdown and new selling price is:

New selling price = Current selling price – (Current selling price × %markdown) = Current selling price (1 - %markdown)

#### Rs Markdown

Markdown in terms of rupees is called Rs markdown.

- 1. New selling price = Current selling price Rs Markdown
- 2. Rs markdown = Current selling price × %markdown

Let us look at an example to understand how markdown is calculated. **MARKDOWN-EXAMPLE 1** 

An item originally priced at 3,300 Rs. is marked 25% off. What is the sale price? <u>Markdown</u> First, find the Rs markdown. The markdown is 25% of the original price or current selling price, as Rs markdown = original price × %markdown

= (0.25)(3300) = 825Rs

## Selling Price

Then calculate the sale price, by subtracting the markdown from the original price: New Selling price = 3,300 - 825 = 2,475Rs The sale price is 2,475 Rs.

## Calculation using EXCEL

Enter original price 3300 in cell B28. Enter % Markdown 25 in cell B29. Enter formula for Rs. Markdown (=B29/100\*B28) in cell B30. Here the term B29/100 is the markdown in fraction. The result of this part of the calculation is 825. Enter formula for new sale price (=B28-B30) in cell B31. This formula is not shown in the slide.

We could have calculated the new sale price directly also by writing just one formula (=(1-B29/100)\*B28) by using following formula

New selling price = Current selling price (1 - %markdown)

In other words the multiplication factor is calculated as 1-0.25 = 0.75 and multiplied with the original price 3300. The answer would be the same. By breaking the calculation in parts you can check the intermediate result and avoid errors. But if you become very conversant with formulas then you may wish to reduce the number of unnecessary steps in the calculations.

## DISCOUNT

Discount is a reduction in price which the seller offers to the buyer. There are different types of discount.

- 1. Trade discount.
- 2. Cash discount
- 3. Seasonal discount, etc

## TRADE DISCOUNT

When a manufacturer or wholesaler offers goods for sale, a list price or retail price is set for each item. This is the suggestion price to be charged from the ultimate consumer. A discount on the list price granted by a manufacturer or wholesaler to buyers in the same trade is called trade discount. Trade discount represents a reduction in list price in return for quantity purchases. Thus

Rs Trade discount = list price × discount rate Net price = list price – Rs trade discount

There are two main types of trade discounts

- 1. Single trade discount.
- 2. Multiple or series trade discount

## SINGLE TRADE DISCOUNT-EXAMPLE 1

The price of office equipment is 3000 Rs. The manufacturer offers a 30% trade discount. Find the net price and the trade discount amount.

 $\frac{\text{Discount}}{\text{Net Price}} = L(1 - d)$ = 3000(1 - 0.3) = 3000(0.7) = 2100 Rs. Amount of discount = dL = 0.3 × 3000 = 900 Rs.

#### **Calculation using EXCEL**

Enter price of equipment 3000 in cell B39.

Enter % trade Discount 30 in cell B40.

Enter formula for Rs. Discount =B40/100\*B3 in cell B41. Here the term B40/100 is the discount in fraction. The result of this part of the calculation is 900.

Enter formula for net price =B39-B41 in cell B42. This formula is not shown in the slide. The result is 2100 as shown in cell B42.

## LECTURE 14 MATHEMATICS OF MERCHANDISING PART 2

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 13
- Financial Mathematics Part 1

## SERIES TRADE DISCOUNT

This refers to the giving of further discounts as incentives for more sales. Usually such discount is offered for selling product in bulk.

If series discount of 15%, 10%, 5% are offered on list price, say L, of an item then net price is calculated as follows: Subtract 15% of L from L. Let the new price is L<sub>1</sub>.  $L_1 = L - (L \times 15\%)$ Then subtract 10% of L<sub>1</sub> from L<sub>1</sub>. Let the new price is L<sub>2</sub>.  $L_2 = L_1 - (L_1 \times 10\%)$ Then subtract 5% of L<sub>2</sub> from L<sub>2</sub>. The new price is net price of an item.  $N = L_2 - (L_2 \times 5\%)$ Or alternatively N = L (1 - 15%) (1 - 10%) (1 - 5%)Let d<sub>1</sub> = 15%, d<sub>2</sub> = 10%, d<sub>3</sub> = 5%, then above formula becomes  $N = L (1 - d_1)(1 - d_2)(1 - d_3)$ 

<u>*Remember:*</u> total discount is not 15% + 10% + 5% = 30%

## SERIES TRADE DISCOUNT-EXAMPLE

The price of office furniture is Rs. 20,000 The series discounts are: 20%,10%, 5% What is the net price? For series trade Discount Net price =  $(1-d_1)(1-d_2)(1-d_3)$ Here  $d_1 = 20\%$ ,  $d_2 = 10\%$ ,  $d_3 = 5\%$ . So

Net price = 20,000(1-0.2)(1-0.10)(1-0.05)= 20,000(0.8)(0.9)(0.95)= 20,000(0.6840)= **13,680 Rs.**

## LIST PRICE

An order for power tools has a Rs. 2100 net price after a 30% trade discount. What is the list price?

 $\frac{\text{Net Price}}{\text{Net Price}} = L(1 - d)$ L = N / (1 - d)

- = 2100/(1-0.3)
- = 2100 / (0.7)
- = 3000 Rs.

## **EXCEL Calculation**

EXCEL formula for list price was based on the calculation = 2100/(1 - 0.3). The net price was entered in cell B67. % Trade discount was entered in B69. The formula for list price was entered in cell B71 as =B67/ (1-B69/100). The answer is shown in cell C72 as 3000.

## TRADE DISCOUNT-EXAMPLE 2

Find the single discount rate that is equivalent to the series 15%, 10% and 5%. **Trade Discount** 

## Apply the multiple discount to a list price of Rs. 100. Net price = $(1-d_1)(1-d_2)(1-d_3)$

$$= 100(1 - 15\%) (1 - 10\%) (1 - 5\%)$$
  
=100(0.85) (0.9) (0.95)  
= 100(0.7268)  
= 72.68  
% Discount = 100 - 72.68  
= 27.62%

## **EXCEL Calculation**

EXCEL formula for net price was based on the calculation

=100\*(1-0.15)\*(1-0.1)\*(1-0.05) The formula for net price was entered in cell F8. The formula is shown in cell F8. The answer is shown in cell F12.

# CASH DISCOUNT

A seller always desires to be paid by the buyer as soon as possible. A discount given for the prompt payment of the dues is called Cash Discount. Such a discount is an advantage to both the seller and the buyer. The buyer has a saving of money while the seller has funds at his disposal.

Cash Discount is allowed on Invoices, Returned Goods, Freight, Sales Tax and

A common business phrase for a cash discount is "3/10, net/30," meaning that a 3% discount is offered if the amount due is paid within 10 days; otherwise 100% of the amount due is payable in 30 days. For example, if the amount due is 100Rs, the buyer may pay 97Rs within 10 days or 100 Rs within 30 days.

# **DISCOUNT PERIODS**

Discount Periods are periods for the buyer to take advantage of Discount Terms. <u>CREDIT PERIODS</u> Credit Periods are periods for the buyers to pay invoices within specified times. CASH DISCOUNT-EXAMPLE

Invoice was dated May 1<sup>st</sup>. The terms 2/10 mean that 2% discount is offered if invoice is paid up to 10<sup>th</sup>May.

What is the net payment for invoice value of Rs. 50,000 if paid up to 10<sup>th</sup> May?

# Cash Discount

N = L(1 - d)

- = 50,000(1-0.02)
- = 50,000(0.98)
- = 49,000 Rs.

# EXCEL Calculation

EXCEL formula for net price was based on the calculation = 50000\*(1-0.02). However, here an IF condition was applied, that means that if the payment date in cell D31 (\$ sign is put in front of row and column to fix its location) is less than or equal to 10 May then the discount will be as given in cell D30. Here also \$ sign was used to fix the location of the cell.

In cell D38, the date was changed to 11 May and the same formula was applied again. The result as shown in cell D39 and D40 are 0% (for % discount) and 0 Rs( for Rs. Discount).

#### LECTURE 15 MATHEMATICS OF MERCHANDISING PART 3

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 14
- Financial Mathematics Part 2

# PARTIAL PAYMENTS

When you buy on credit and have cash discount terms, part of the invoice may be paid within the specified time. These part payments are called **Partial Payments**. Let us look at an example: You owe Rs. 40,000. Your terms were 3/10 (3% discount by 10<sup>th</sup> day). Within 10 days you sent in a payment of Rs. 10,000. Rs. 10,000 was a part payment. How much is your new balance?

First we will find the amount that if 3% discount is given on it, the net amount is 10000Rs. Let that amount is t.Then 10000 = t (1 - 0.03)

This implies,  $t = \frac{10000}{(1 - 0.03)}$ 

Thus, t = 10309Rs This means that although you pay 10,000Rs, due to 3% cash discount 10309Rs among 40,000Rs is paid. Hence the new balance = 40000 - 10309 = 29691Rs.

#### MARKETING TERMS

There are a number of marketing terms. First of these is the **Manufacturer Cost**. This is the cost of manufacturing. Next is the price charged to middlemen in 'The Distribution Chain'. The Distributor>Wholesaler>Retailer is a chain. The next term is the **Selling Price**. This is the price charged to Consumers by Retailers. It may or may not be the same as list price.

#### MARKETING, OPERATING EXPENSES AND SELLING PRICE

Gross Sales less Cost of Goods sold gives the Gross Profit. The gross Profit less the Operating Expenses gives the Net Profit.

#### **Operating Expenses**

Expenses the company incurs in operating the business, e.g. rent, wages and utilities is called operating Expenses.

# Selling Price

Selling Price is composed of Cost and Rs Markup. Selling Price (S) = Cost (C) + Rs Markup (M)

#### MARGIN

While determining Sale Price, a company includes the operating expenses and profit to their own cost. This amount is called the margin of the company. It is usually calculated

as percentage but can also be expressed as rupees. It is also named as **markup on** sale.

Margin or markup on sale = <u>Selling price - Cost price</u> ×100% Selling Price Selling price = Cost price + Rs Margin

Margin and markup confuse many. By margin, company evaluates that for every rupee generated in sales, how much is left over to cover basic operating costs and profit. Markup represents the amount added to a cost to arrive at a selling price

Markup on cost = <u>Selling price – Cost price</u> ×100% Cost price

For example, an item costs 50Rs, and is sold for 100Rs,

Markup =  $\frac{100 - 50}{50} \times 100\%$  = 100% Margin =  $\frac{100 - 50}{100} \times 100\%$  = 50%

# Note: Remember unless it is mentioned that markup is on sale, simple markup means markup on cost.

# Example

A computer's cost is 9000Rs. An amount of Rs. 3,000 was added to this cost by the retailer to determine the sale price for the consumer. Thus, the selling price

= 9,000 + 3,000 Rs.

= 12,000 Rs.

Rs. 3,000 is Margin available to meet Expenses and make a Profit.

# MARKUP

If the Markup on cost 33% then... Selling Price (S) = Cost (C) + {Cost (C) × Markup on cost (MUC)}  $S = C + (C \times MUC)$ 

# MARKUP-EXAMPLE

You buy candles for Rs. 10. You plan to sell them for Rs.15. What is your Rs. Markup? What is your percent Markup on cost? Rs Markup = Selling price – cost price Selling price – Cost = 15 – 10 = Rs Markup = Rs. 5 Markup on cost = <u>Selling price – Cost price</u> ×100% Cost price

%Markup = 5/10\*100% = 50%

#### SELLING PRICE

Fawad's Appliances bought a sewing machine for Rs. 1,500. To make the desired profit, he needs a 60% Markup on Cost. What is Fawad's Rs. Markup? What is his Selling price?

# Selling Price

Rs Markup = Cost price × %Markup on cost Rs. Markup = 1,500 x 0.6 = 900 Rs.

Selling Price (S) = Cost (C) + Rs Markup (M) Selling Price = 1,500 + 900 = 2,400 Rs. Or Alternatively, since Selling Price (S) = Cost (C) + {Cost (C) × Markup on cost (MUC)}

 $S = C + (C \times MUC)$ = C (1 + MUC)

Selling price

= 1,500 x (1+0.6) = 1,500 x 1.6 = 2,400 Rs.

# EXCEL Calculation

Here 1,500 is the Sewing machine cost in cell F4 and 60 is the Percent Markup on cost in cell F5.

EXCEL formula in cell F6 for Rs. Markup was based on the calculation =60/100\*1500.

The Selling price was calculated in cell F7 by using the formula =F4+F6. The answer, 2400, is shown in cell F7.

RS. MARKUP AND PERCENT ON COST Tanveer's flower business sells floral arrangements for Rs. 35. To make his desired profit, Tanveer needs a 40% Markup on cost. What do the flower arrangements cost Tanveer? What is the Rs. Markup?

# Rs. Markup and Percent Markup on Cost

Sale price  $S = Cost \overline{C} + \{C \times Markup \text{ on } cost (MUC)\}$ S = C + 0.40(C)35 = 1.40(C)C = 35/1, 4 = 25 Rs.Rs Markup =  $25 \times 0.4$ = 10 Rs.

#### **EXCEL Calculation**

Here 35 is the Selling price-floral arrangement in cell H15. % Markup on cost is in cell H16. EXCEL formula in cell H18 for Cost was based on the calculation = 35/1.4. The Rs. Markup was calculated in cell H19 by using the formula =H18\*H16/100. The answer, as shown in cell H19, was 10.

# MARKUP AGAIN

You buy candles for 2 Rs. You plan to sell them for 2.50 Rs What is your Rs. Markup? What is your Percent Markup on Selling Price?

# <u>Rs. Markup</u>

Rs. Markup = 2.5 – 2 = 0.5 Rs.

# Percent Markup on Selling Price

As explained in lecture 13 Cost price = Selling price (1 – %Markup on sale)

Markup on selling price = <u>Selling price - Cost price</u> ×100% Selling price

Markup on Selling Price =  $(0.5/2.5) \times 100\%$ = 20%

# EXCEL Calculation

Here 2 is the Purchase price in cell E30.

Sale price is entered in cell E31.

Rs. Markup on Purchase Price was calculated by using the formula =E31-E30 in cell E32.

The % Markup on sale price was calculated in cell E33 by using the formula =E32/E31\*100.

The answer, as shown in cell E35, was 10 20.

#### SELLING PRICE

Fawad's Appliances bought a sewing machine for Rs. 1,500. To make the desired profit, he needs a 60% Markup on Selling price. What is Fawad's Rs. Markup? What is his Selling Price?

#### Selling Price

As explained in lecture 13 Selling Price = Cost price + (Selling price × %Markup on sale)

Selling Price S = 1,500 + 0.6S S - 0.6S = 1,500 Rs. Or 0.4S = 1,500 = 3,750 Rs

# Rs. Markup

Rs. Markup = 3,750 x 0.6 = 2,250 Rs.

# EXCEL Calculation

Here 1500 is the Purchase price in cell E39.

% Markup on Sale Price is entered as 60 in cell E40.

Sale Price was calculated by using the formula =E39/(1-E40/100). The result 3750 is shown in cell D41.

EXCEL formula in cell E42 for Rs. Markup was = E41-E39. The result 2250 is shown in cell E42.

Basic formula S=C+0.6S is shown in cell A44. In cell A45 it was simplified to 0.4=C. In cell A46, it is rewritten as S=C/0.4S=C/(1-muc)=C/0.4. Here muc is the %Markup on cost.

# **RS. MARKUP AND PERCENT MARKUP ON COST**

Tanveer's flower business sells floral arrangements for Rs. 35. To make his desired profit, Tanveer needs a 40% Markup on Selling Price. What do the flower arrangements Cost Tanveer? What is the Rs. Markup?

# Selling Price

Selling Price = Cost price + (Selling price × %Markup on sale)

Selling Price =  $35 = C + (0.4 \times 35)$  35 = C + 14 C = 35 - 14 = 21 Rs.Or, alternatively C = S - 0.4 S  $= 0.6 \text{ S} = 0.6 \times 35 = 21 \text{ Rs.}$  **Rs. Markup Rs. Markup = 35 x 0.4 = 14 Rs.** 

# EXCEL Calculation

Here 35 is the Sale price in cell E50.

% Markup on Sale Price is entered as 40 in cell E51.

Cost was calculated by using the formula =E50\*(1-E51/100). The result 21 is shown in cell D52.

EXCEL formula in cell E53 for Rs. Markup was = E50-E52. The result 14 is shown in cell E53.

Basic formula S=C+0.4S is shown in cell A55. In cell A56 it was simplified to 0.6S=C=S(1-mus).

# **CONVERTING MARKUPS**

Convert 50% Markup (MU) on Cost to %MU on Sale

Formula for converting %Markup on Sale (mus) to %Markup on Cost Price (muc) is:

% Markup on Selling Price (mus) = %Markup on Cost / (1 + %Markup on Cost)

mus = muc/(1+muc)

# <u>Solution</u>

% Markup on Sale (mus) = 0.5 / (1+0.5) = 0.5/1.5 mus= 0.3333 = 33.33%

# **Converting Markups**

Converting 33.33% MU on Sale to %MU on C

# <u>Formula</u>

Convert % Markup on) Cost (muc) to % Markup on selling price (mus):

% Markup on cost = % Markup on S / (1 - % Markup on S)

muc = mus / (1-mus) Markup on cost = 0.3333/(1 - 0.333)= 0.3333/0.6666 = 0.5= 50%

# **EXCEL Calculation**

Here 33.3 is the Markup on sale in cell E61.

EXCEL formula in cell E62 for Markup on cost was = (E61/100)/(1-E61/100)\*100. The result 50 is shown in cell E64.

Basic formula muc=mus / (1-%mus) is shown in cell A65.

# MATHEMATICS OF MERCHANDISING

PART 4

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 15
- Markup and Markdown

# Financial Mathematics Part 3

MARKDOWN

Reduction from original selling Price is called Markdown.

# <u>Formula</u>

%Markdown = (Rs. Markdown / Selling Price (original)) ×100%

# MARKDOWN-EXAMPLE 1

Store A marked down a Rs. 500 shirt to Rs. 360. What is the Rs. Markdown? What is the %markdown? <u>**Rs. Markdown**</u> Let S = Sale price

Rs. Markdown = Old S – New S = Rs. 500 - Rs. 360= Rs. 140 Markdown

# <u>% Markdown</u>

 $\frac{\text{Markdown} = \frac{\text{Markdown} \times 100\%}{\text{Old S}}$ % Markdown =  $\frac{140}{500} \times 100\%$ = 0.28×100% = 28 %

# EXCEL Calculation

Here 500 is the Original price in cell E73.

Price after Markdown is entered as 360 in cell E74.

Rs. Markdown was calculated in cell E75 by using the formula =E73-E74. The result 140 is shown in cell D75.

<b>N</b>	Microsoft Excel - Lecture14_Markup_Discount_Markdown

EXCEL formula in cell E76 for % Markdown was = E75/E73\*100. The result 28 is shown

# MARKDOWN-EXAMPLE 2

A variety of plastic jugs that was bought for Rs. 57.75 was marked up 45% of the SellingPrice.

When the jugs went out of production, they were marked down 40%

What was the Sale Price after the 40% markdown?

Here, there are two parts to this problem. First we must find the original sale price so that markdown can be calculated on that price.

# **Original Sale Price**

Let Selling price = 100%Markup on selling price = 45%Cost = 100 - 45 = 55Thus Original Sale price =  $(100/55) \times 57.75 = 105$ Rs

# <u>Rs. Markdown</u>

%Markdown = 40% = 0.4 Rs. Markdown = 105 x 0.4 = 42

# Sale price after markdown

Sale price after markdown = 105 - 42 = 63 Rs.

# EXCEL Calculation

Here 57.75 is the purchase price in cell F83. Selling price is entered as 100in cell F84. Rs. Markup was calculated in cell F85 using the formula =F84-F83. The result is shown as 45 in cell F85. Original Sale Price was calculated in cell F87 by using the formula =F84/F86\*F83. The result 105 is shown in cell E87. % Markdown was entered as 40 in cell F88. The Rs. Markdown was calculated using the formula =F87\*F88/100 in cell F89. The result 42 is shown in cell F89. The reduced price was calculated by using the formula =F87-F89 in cell F90. The result is shown as 63 in cell F90.

# PROJECT FINANCIAL ANALYSIS

Financial analysis is the analysis of the accounts and the economic prospects of a firm, which can be used to monitor and evaluate the firm's financial position, to plan future financing, and to designate the size of the firm and its rate of growth.

When you carry out Project Financial analysis, a number of Financial Calculations are required. The important ones are summarized below:

- Cost estimates
- Revenue estimates
- Forecasts of costs
- Forecasts of revenues
- Net cash flows
- Benefit cost analysis
- Internal Rate of Return
- Break-Even Analysis

#### COST ESTIMATES

In every project you will be required to prepare a cost estimate. Generally, such cost estimates cover calculations based on quantities and unit rates. Such calculations are done in the form of tabular worksheets. In large projects there may be a number of separate calculations for part projects. Such component costs are then combined to calculate total cost. These are simple worksheet calculations unless conditional processing is required. Such conditional processing is useful if unit prices are to be found for a specific model from a large database.

#### **REVENUE ESTIMATES**

Along with costs even revenues are calculated. These calculations are similar to component costs.

#### FORECASTS OF COSTS

Forecasting requires a technique for projections. One of such technique, Time Series Analysis, will be covered later in this course. Forecasting techniques vary from case to case. The applicable method should be determined first. Calculation of future forecasts can then be done through worksheets.

#### FORECASTS OF REVENUES

These will be done similar to the forecast of costs. Here also the method must be determined first. Once the methodology is clear, the worksheets can be prepared easily.

# NET CASH FLOWS

The difference between Revenue and Cost is called the Net Cash flow. This is an important calculation as the entire Project Operation and Performance is based on its cash flows.

#### BENEFIT COST ANALYSIS

This is the end result of the Project Analysis. The ratio between Present Worth of Benefits and Costs is called the Benefit Cost (BC) ratio. For a project to be viable without profit or loss, the BC Ratio must be 1 or more. Generally a BC Ratio of 1.2 is considered acceptable. For Public projects even lesser BC ratio may be accepted for social reasons.

#### INTERNAL RATE OF RETURN

Internal Rate of Return or IRR is that Discount Rate at which the Present Worth of Costs is equal to the Present Worth of Benefits. IRR is the most important parameter in Financial and Economic Analysis. There are a number of functions in EXCEL for calculation of IRR.

#### **BREAK-EVEN ANALYSIS**

In every project where investment is made it is important to know how long it takes to recover the investment. It is also important to find the breakeven point where the Cash Inflow becomes equal to Cash Outflow. After that point the company has a positive cash flow (i.e. there is surplus cash after meeting expenses).

#### LECTURE 17 MATHEMATICS FINANCIAL MATHEMATICS INTRODUCTION TO SIMULTANEOUS EQUATIONS

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 16
- Financial Mathematics
- Introduction to Linear Equations

# MARKDOWN

# Module 4

Module 4 covers the following:

- Financial Mathematics (Lecture 17)
- Applications of Linear Equations
- (Lecture 17-18)
- Break-even Analysis
- (Lectures 19-22)
- Mid-Term Examination

#### **PROJECT FINANCIAL ANALYSIS**

Project Financial Analysis covers the following:

- Cost estimates
- Revenue estimates
- Forecasts of costs
- Forecasts of revenues
- Net cash flows
- Benefit cost analysis
- Internal Rate of Return
- Break-Even Analysis

### **EXCEL FUNCTIONS FOR FINANCIAL ANALYSIS**

List of Excel Financial functions is as under. The name and utility of each function is given below:

#### AMORDEGRC

Returns the depreciation for each accounting period. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account. The function is similar to AMORLINC, except that a depreciation coefficient is applied in the calculation depending on the life of the assets.

# **Syntax**

# AMORDEGRC(cost,date\_purchased,first\_period,salvage,period,rate,basis)

**Important** Dates should be entered by using the DATE function, or as results of other formulas or functions. For example, use DATE(2008,5,23) for the 23rd day of May, 2008. Problems can occur if dates are entered as text.

Cost cost of the asset. Date\_purchased date of the purchase of the asset. First\_period date of the end of the first period. Salvage salvage value at the end of the life of the asset. Period period. Rate rate of depreciation.

Basis year basis to be used.

# Basis Date system

0 or omitted 360 days (NASD method)

- 1 Actual
- 3 365 days in a year
- 4 360 days in a year (European method)

# Remarks

- Microsoft Excel stores dates as sequential serial numbers so they can be used in calculations. By default, January 1, 1900 is serial number 1, and January 1, 2008 is serial number 39448 because it is 39,448 days after January 1, 1900.
- This function will return the depreciation until the last period of the life of the assets or until the cumulated value of depreciation is greater than the cost of the assets minus the salvage value.
- The life of the asset is calculated by (1 / "rate"). The depreciation coefficient depends on the life of the asset.
- If the life of the asset is between 3 and 4 years, the coefficient is 1.5.
- If the life of the asset is between 5 and 6 years then the coefficient is 2.
- If the life is the asset is greater than 6 years then the coefficient is 2.5.
- The depreciation rate will grow to 50 percent for the period preceding the last period and will grow to 100 percent for the last period.
- If the life of assets is between 0 (zero) and 1, 1 and 2, 2 and 3, or 4 and 5, the #NUM! error value is returned.

See its example in next lecture.

# AMORLINC

Returns the depreciation for each accounting period. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account.

# Syntax

#### AMORLINC(cost,date\_purchased,first\_period,salvage,period,rate,basis)

**Cost** cost of the asset

**Date\_purchased** date of the purchase of the asset.

**First\_period** date of the end of the first period.

**Salvage** salvage value at the end of the life of the asset.

Period period.

**Rate** rate of depreciation.

Basis year basis to be used.

# Basis Date system

0 or omitted 360 days (NASD method)

- 1 Actual
- 3 365 days in a year
- 4 360 days in a year (European method)

#### AMORLINC-EXAMPLE

	Data	Description
A2	2400	Cost
A3	8/19/2008	Date purchased
A4	12/31/2008	End of the first period

A5	300	Salvage value
A6	1	Period
A7	15%	Depreciation rate
A8	1	Actual basis (see above)

#### Formula

=AMORLINC(A2,A3,A4,A5,A6,A7,A8)

Result Description First period depreciation (360)

# **CUMIPMT**

Returns the cumulative interest paid between two periods. For description see lecture 8.

# **CUMPRINC**

Returns the cumulative principal paid on a loan between two periods For description see lecture 8.

# <u>DB</u>

Returns the depreciation of an asset for a specified period using the fixed-declining balance method. **Syntax** 

DB(cost,salvage,life,period,month)

**Cost** is the initial cost of the asset.

**Salvage** is the value at the end of the depreciation (sometimes called the salvage value of the asset).

Life is the number of periods over which the asset is being depreciated (sometimes called the useful life of the asset).

**Period** is the period for which you want to calculate the depreciation. Period must use the same units as life.

**Month** is the number of months in the first year. If month is omitted, it is assumed to be 12. **Remarks** 

 The fixed-declining balance method computes depreciation at a fixed rate. DB uses the following formulas to calculate depreciation for a period: (cost - total depreciation from prior periods) \* rate where:

rate = 1 - ((salvage / cost) ^ (1 / life)), rounded to three decimal places

- Depreciation for the first and last periods is a special case. For the first period, DB uses this formula:
  - cost \* rate \* month / 12
- For the last period, DB uses this formula: ((cost - total depreciation from prior periods) \* rate \* (12 - month)) / 12

#### DDB

Returns the depreciation of an asset for a specified period using the double-declining balance method or some other method you specify

# Syntax

#### DDB(cost,salvage,life,period,factor)

**Cost** is the initial cost of the asset.

**Salvage** is the value at the end of the depreciation (sometimes called the salvage value of the asset). This value can be 0.

**Life** is the number of periods over which the asset is being depreciated (sometimes called the useful life of the asset).

**Period** is the period for which you want to calculate the depreciation. Period must use the same units as life.

**Factor** is the rate at which the balance declines. If factor is omitted, it is assumed to be 2 (the double-declining balance method).

**Important** All five arguments must be positive numbers.

#### Remarks

- The double-declining balance method computes depreciation at an accelerated rate. Depreciation is highest in the first period and decreases in successive periods. DDB uses the following formula to calculate depreciation for a period: Min( (cost - total depreciation from prior periods) \* (factor/life), (cost - salvage - total depreciation from prior periods) )
- Change factor if you do not want to use the double-declining balance method.

# MIRR

Returns the modified internal rate of return for a series of periodic cash flows. MIRR considers both the cost of the investment and the interest received on reinvestment of cash.

# **Syntax**

#### MIRR(values,finance\_rate,reinvest\_rate)

**Values** is an array or a reference to cells that contain numbers. These numbers represent a series of payments (negative values) and income (positive values) occurring at regular periods.

Values must contain at least one positive value and one negative value to calculate the modified internal rate of return. Otherwise, MIRR returns the #DIV/0! error value.

If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value zero are included.

Finance\_rate is the interest rate you pay on the money used in the cash flows.

**Reinvest\_rate** is the interest rate you receive on the cash flows as you reinvest them.

#### INTERNAL RATE OF RETURN IRR

Returns the internal rate of return for a series of cash flows

# Syntax

**IRR**(values,guess)

**Values** is an array or a reference to cells that contain numbers for which you want to calculate the internal rate of return.

- Values must contain at least one positive value and one negative value to calculate the internal rate of return.
- IRR uses the order of values to interpret the order of cash flows. Be sure to enter your payment and income values in the sequence you want.
- If an array or reference argument contains text, logical values, or empty cells, those values are ignored.

**Guess** is a number that you guess is close to the result of IRR.

- Microsoft Excel uses an iterative technique for calculating IRR. Starting with guess, IRR cycles through the calculation until the result is accurate within 0.00001 percent. If IRR can't find a result that works after 20 tries, the #NUM! error value is returned.
- In most cases you do not need to provide guess for the IRR calculation. If guess is omitted, it is assumed to be 0.1 (10 percent).
- If IRR gives the #NUM! error value, or if the result is not close to what you expected, try again with a different value for guess.

#### IRR-EXAMPLE

In the slide the Excel worksheet is shown.

128

In cell A97, the investment of 70,000 is entered with minus sign to denote negative cash flow.

In cell A98 to A102, revenue per year (1 to 5) is entered.

=IRR(A97:A101) formula in cell A103, only years 1 to 4 were selected from the revenue stream. The IRR is -2% in this case.

In the next formula in cell A105, the entire revenue stream was considered. The IRR improved to 9%.

Next only first 2 years of revenue stream were considered with an initial guess of -10%. The result was -44%.

# LECTURE 19 PERFORM BREAK-EVEN ANALYSIS EXCEL FUNCTIONS FINANCIAL ANALYSIS

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 18
- Perform break-even analysis
- MS EXCEL Financial Functions

# <u>SLN</u>

# Returns the straight-line depreciation of an asset for one period Syntax:

# SLN(cost,salvage,life)

**Cost** is the initial cost of the asset.

**Salvage** is the value at the end of the depreciation (sometimes called the salvage value of the asset).

Life is the number of periods over which the asset is depreciated (sometimes called the useful life of the asset).

# <u>SYD</u>

Returns the sum-of-years' digits depreciation of an asset for a specified period **Syntax** 

# SYD(cost,salvage,life,per)

**Cost** is the initial cost of the asset.

**Salvage** is the value at the end of the depreciation (sometimes called the salvage value of the asset).

**Life** is the number of periods over which the asset is depreciated (sometimes called the useful life of the asset).

**Per** is the period and must use the same units as life. **Remark** 

• SYD is calculated as follows:

 $SYD = \frac{(\cos t - salvage) \star (life - per + 1) \star 2}{(life)(life + 1)}$ 

# <u>VDB</u>

Returns the depreciation of an asset for any period you specify, including partial periods, using the double-declining balance method or some other method you specify. VDB stands for variable declining balance.

# Syntax

# VDB(cost,salvage,life,start\_period,end\_period,factor,no\_switch)

**Cost** is the initial cost of the asset.

**Salvage** is the value at the end of the depreciation (sometimes called the salvage value of the asset).

Life is the number of periods over which the asset is depreciated (sometimes called the useful life of the asset).

**Start\_period** is the starting period for which you want to calculate the depreciation. Start\_period must use the same units as life.

**End\_period** is the ending period for which you want to calculate the depreciation. End\_period must use the same units as life.

**Factor** is the rate at which the balance declines. If factor is omitted, it is assumed to be 2 (the double-declining balance method). Change factor if you do not want to use the double-declining balance method. For a description of the double-declining balance method, see DDB.

**No\_switch** is a logical value specifying whether to switch to straight-line depreciation when depreciation is greater than the declining balance calculation.

If no\_switch is TRUE, Microsoft Excel does not switch to straight-line depreciation even when the depreciation is greater than the declining balance calculation. • If **no\_switch** is **FALSE** or omitted, Excel switches to straight-line depreciation when depreciation is greater than the declining balance calculation. All arguments except no\_switch must be positive numbers.

All arguments except no\_switch must be positive numbers.

# <u>IRR</u>

Returns the internal rate of return for a series of cash flows represented by the numbers in values. These cash flows do not have to be even, as they would be for an annuity. However, the cash flows must occur at regular intervals, such as monthly or annually. The internal rate of return is the interest rate received for an investment consisting of payments (negative values) and income (positive values) that occur at regular periods. **Syntax** 

#### IRR(values, guess)

**Values** is an array or a reference to cells that contain numbers for which you want to calculate the internal rate of return.

- **Values** must contain at least one positive value and one negative value to calculate the internal rate of return.
- **IRR** uses the order of values to interpret the order of cash flows. Be sure to enter your payment and income values in the sequence you want.
- If an array or reference argument contains text, logical values, or empty cells, those values are ignored.

**Guess** is a number that you guess is close to the result of IRR.

- Microsoft Excel uses an iterative technique for calculating IRR. Starting with guess, IRR cycles through the calculation until the result is accurate within 0.00001 percent. If IRR can't find a result that works after 20 tries, the #NUM! error value is returned.
- In most cases you do not need to provide guess for the IRR calculation. If guess is omitted, it is assumed to be 0.1 (10 percent).
- If IRR gives the #NUM! error value, or if the result is not close to what you expected, try again with a different value for guess.

# <u>Remarks</u>

IRR is closely related to **NPV**, the net present value function. The rate of return calculated by IRR is the interest rate corresponding to a 0 (zero) net present value. The following formula demonstrates how NPV and IRR are related:

NPV(IRR(B1:B6),B1:B6) equals 3.60E-08 [Within the accuracy of the IRR calculation, the value 3.60E-08 is effectively 0 (zero).]

### IRR-EXAMPLE

In the slide the Excel worksheet is shown.

In cell A97, the investment of 70,000 is entered with minus sign to denote negative cash flow.

In cell A98 to A102, revenue per year (1 to 5) is entered.

In the first formula in cell A103 (=IRR(A97:A101)), only years 1 to 4 were selected for the revenue stream. The IIR is -2% in this case.

In the next formula in cell A105, the entire revenue stream was considered. The IRR improved to 9%.

Next only first 2 years of revenue stream were considered with an initial guess of 10% (not shown in slide). The result was -44%.

#### <u>XIRR</u>

Returns the internal rate of return for a schedule of cash flows that is not necessarily periodic. To calculate the internal rate of return for a series of periodic cash flows, use the IRR function.

If this function is not available, and returns the #NAME? error, install and load the Analysis ToolPak add-in. To do that:

- 1. On the **Tools** menu, click **Add-Ins**.
- 2. In the Add-Ins available list, select the Analysis ToolPak box, and then click OK.
- 3. If necessary, follow the instructions in the setup program.

# Syntax

# XIRR(values,dates,guess)

**Values** is a series of cash flows that corresponds to a schedule of payments in dates. The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it must be a negative value. All succeeding payments are discounted based on a 365-day year. The series of values must contain at least one positive and one negative value.

**Dates** is a schedule of payment dates that corresponds to the cash flow payments. The first payment date indicates the beginning of the schedule of payments. All other dates must be later than this date, but they may occur in any order. Dates should be entered by using the DATE function, or as results of other formulas or functions. For example, use DATE(2008,5,23) for the 23rd day of May, 2008. Problems can occur if dates are entered as text.

Guess is a number that you guess is close to the result of XIRR.

# Remarks

- Microsoft Excel stores dates as sequential serial numbers so they can be used in calculations. By default, January 1, 1900 is serial number 1, and January 1, 2008 is serial number 39448 because it is 39,448 days after January 1, 1900. Microsoft Excel for the Macintosh uses a different date system as its default.
- Numbers in dates are truncated to integers.
- XIRR expects at least one positive cash flow and one negative cash flow; otherwise, XIRR returns the #NUM! error value.
- If any number in dates is not a valid date, XIRR returns the #VALUE! error value.
- If any number in dates precedes the starting date, XIRR returns the #NUM! error value.
- If values and dates contain a different number of values, XIRR returns the #NUM! error value.
- In most cases you do not need to provide guess for the XIRR calculation. If omitted, guess is assumed to be 0.1 (10 percent).
- XIRR is closely related to XNPV, the net present value function. The rate of return calculated by XIRR is the interest rate corresponding to XNPV = 0.
- Excel uses an iterative technique for calculating XIRR. Using a changing rate (starting with guess), XIRR cycles through the calculation until the result is accurate within 0.000001 percent. If XIRR can't find a result that works after 100 tries, the #NUM! error value is returned. The rate is changed until:

where:  $\sum_{j=1}^{N} \frac{P_j}{(1+rate)^{\frac{(d_j'-d_j)}{365}}}$ 0 =

di = the ith, or last, payment date.

d1 = the 0th payment date.

Pi = the ith, or last, payment.

# XIRR EXAMPLE

Here, the investment is in cell A111. The revenue stream is in cells A112 to a115. The dates for each investment or revenue are given in cells B111 to B115. Please note that the dates are in European format year-month-day. On your computer, you may not have this format.

In cell A116, the formula =XIRR(A111:A115;B111:B115;0.1), the range A111:A115 is the cost and revenue stream. The range B111:B115 is the stream for dates. The third term 0.1 is the initial guess for XIRR.

The answer in fraction or % is given in cell B116(37.34%).

# LINEAR EQUATIONS

Linear equations have following applications in Merchandising Mathematics:

- Solve two linear equations with two variables
- Solve problems that require setting up linear equations with two variables
- Perform linear Cost-Volume-Profit and break-even analysis employing:
- The contribution margin approach
- The algebraic approach of solving the cost and revenue functions

# SOLVING LINEAR EQUATIONS -

Here is an example of solving simultaneous linear equations.

2x - 3y = -6 x + y = 2Solve for y 2x - 3y = -6 2x + 2y = 4 -5y = -10 y = 10/5y = 2 Let us look at the same equations again. 2x - 3y = -6 x + y = 2We solved for x. Now let us substitute y by 2 2x - 3(2) = -6 2x - 6 = -6 2x = 0x = 0

# Check your answer

By substituting the values into <u>each of the equations</u> Equation 1: 2x - 3y = -6 x = 0 y = 2LHS = 2x - 3y = 2(0)-3(2) = -6 = RHSEquation 2: x + y = 2LHS = x + y = 0 + 2 = 2 = RHSThe right side is equal to left hand side. Hence the answer is correct.

#### LECTURE 20 PERFORM BREAK-EVEN ANALYSIS EXCEL FUNCTIONS FOR FINANCIAL ANALYSIS

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 18
- MS EXCEL Financial Functions
- Perform Break-Even Analysis.

#### LINEAR EQUATIONS

Zain purchases the same amount of commodity 1 and 2 each week. After price increases from Rs. 1.10 to Rs. 1.15 per item of commodity 1, and from Rs. 0.98 to Rs. 1.14 per item of commodity 2, the weekly bill rose from Rs. 84.40 to Rs. 91.70.

How many items of commodity 1 and 2 are purchased each week?

Let x = # of commodity 1 Let y = # of commodity 2 Setting up Linear Equations Equation 1 1.10x +0.98y= 84.40 (1) Eliminate x in (1) by Dividing both sides by 1.10. (1.10x + 0.98y)/1.10 = 84.40/1.10x + 0.8909y = 76.73Equation 2 1.15x+1.14y=91.7 (2) Eliminate x in (2) by Dividing both sides by 1.15 (1.15x + 1.14y)/1.15 = 91.70/1.15x + 0.9913y = 79.74 Result 1: x + 0.8909y = 76.73(3) x + 0.9913y = 79.74(4) Next: Subtract (4) from (3): Result 2: 0.1004y = 3.01y = 3.01/0.1004Or y=29.98 approximantely 30 30 items of commodity 2 are purchased each week 1.10x + 0.98y = 84.40<u>Substitution</u> Substitute value of y in (1). Result: 1.10x + 0.98(29.98) = 84.40Solve: 1.10x + 29.38 = 84.401.10x = 84.40 - 29.381.10x = 55.02Result: x = 50.02 approximately 50 50 items of commodity 1 are purchased each week

#### <u>Check your answer</u> <u>New weekly cost</u> <u>Commodity 1:</u> 50 x 1.15 = 57.50Rs <u>Commodity 2:</u> 30 x 1.14 = 34.20 Total cost = 91.70Rs

# T<u>ERMINOLOGY</u>

There are either Business Costs or Expenses.

# Break Even Analysis

Break Even Analysis refers to the calculation to determine how much product a company must sell in order to get break even point (The point at which no profit is made and no losses are incurred) on that product. Break-even analysis provides insight into whether or not revenue from a product or service has the ability to cover the relevant costs of production of that product or service. Managers can use this information in making a wide range of business decisions, including setting prices, preparing competitive bids, and applying for loans.

# Cost-Volume-Profit Analysis

Cost-volume-profit (CVP) analysis expands the use of information provided by breakeven analysis. It deals with how profits and costs change, with a change in volume. More specifically, it looks at the effects on profits by changes in such factors as variable costs, fixed costs, selling prices, volume. By studying the relationships of costs, sales, and net income, management is better able to cope with many planning decisions. For example, CVP analysis attempts to answer the following questions: (1) What sales volume is required to break even? (2) What sales volume is necessary in order to earn a desired (target) profit? (3) What profit can be expected on a given sales volume? (4) How would changes in selling price, variable costs, fixed costs, and output affect profits?

# Fixed Costs (FC)

Fixed Costs are such costs that do not change if sales increase or decrease e.g. rent, property taxes, some forms of depreciation.

# Variable Costs (VC)

Variable costs do change in direct proportion to sales volume e.g. material costs and direct labor costs.

# Production Capacity (PC)

It is the number of units a firm can make in a given period.

# Break Even Point

Break Even point is a point at which neither a profit nor loss is made. Revenue is exactly equal to costs. Break even point can be expressed as

- 1. units
- 2. Sales or Rupees (Rs)
- 3. Percent of capacity

**BEP in units** calculates how many units should be sold to break even. If the product is sold in a quantity greater than this, the firm will makes a profit; below this point, a loss.

BEP in units = Fixed Costs

Contribution Margin per unit

**BEP in Rs** calculates the revenue that must be obtained to reach break even point.

BEP in Rs =	Fixed Costs	×	Net Sales
	Contribution Margin		

BEP in Rs = <u>Fixed costs</u> × Selling Price per unit

**BEP as percent of capacity** calculates what percent of production capacity will be utilized to produce the number of units required to reach break even point.

BEP as % of capacity =  $\underline{\text{BEP in units}} \times 100 \%$ Production capacity

# **Contribution Margin**

Contribution Margin is the Rs. amount that is found by deducting Variable Costs from Sales or revenues and 'contributes' to meeting Fixed Costs and making a 'Net Profit'. It can be calculated on a total or per unit basis.

Contribution Margin = Net Sales - Variable Cost = S - VC

Contribution margin per unit =CM =Sale price per unit – Variable cost per unit

# **Contribution Rate (CR)**

Contribution rate =  $\frac{\text{Contribution Margin}}{\text{Net sales}} \times 100\% = \frac{\text{CM}}{\text{S}} \times 100\%$ 

Contribution rate =  $\frac{\text{Contribution Margin per unit} \times 100\%}{\text{Sale price per unit}} \times \frac{100\%}{\text{S}} = \frac{\text{CM} \times 100\%}{\text{S}}$ 

# A CONTRIBUTION MARGIN STATEMENT

	<u>KS.</u>	<u>%</u>
Net Sales (Price × # Units Sold)		100
Less: Variable Costs		Х
Contribution Margin	Х	Х
Less: Fixed Costs	Х	Х
Net Income	Х	Х

The **net sales** are calculated by multiplying price per unit with number of units sold.

Net Sales = Sale price per unit × number of units sold

This figure is treated as 100%.

Next, variable costs are specified and deducted from the Net sales to obtain the Contribution Margin.

Next, Fixed costs are deducted from the contribution Margin. The result is **Net Income**.

Net Income = Contribution Margin – Fixed Costs

Under the % column, percentage of each item is calculated with respect to the Net Sales.
Net Sales	462,452 Rs	100%
Less: Variable Costs		
Cost of goods sold	230,934 Rs	50%
Sales Commissions	58,852 Rs	12.7%
Delivery Charges	13,984 Rs	3%
Total Variable Costs	(230934 + 58852 + 13984)	
	303,770 Rs	65.7%
Contribution Margin	(462,452 - 303770)	
	158,682 Rs	34.3%
Less: Fixed Costs		
Advertising	1,850 Rs	0.4%
Depreciation	13,250 Rs	2.8%
Insurance	5,400 Rs	1.2%
Payroll Taxes	8,200 Rs	1.8%
Rent	9,600 Rs	2.1%
Utilities	17,801 Rs	3.8%
Wages	40,000 Rs	8.6%
Total Fixed Costs	(1850+13250+5400+8200	
	+9600+17801+40000)	
	96,101 Rs	20.8%
Net Income	(158682 - 96101)	
	62,581 Rs	13.5%

Here's an example.

# **SCENARIO 1**

A firm is planning to add a new item in its product line. Market research indicates that the new product can be sold at Rs. 50 per unit. Cost analysis provides the following information: Fixed Costs (FC) **per period =** Rs. 8640

Variable Costs (VC) = Rs. 30 per unit.

Production Capacity **per period** = 900 units

How much does the sale of an additional unit of a firm's new product contribute towards increasing its net income?

# <u>Formula</u>

Contribution Margin per unit = CM = S – VC Contribution Rate = CR = CM/S × 100% \*Break Even Point (BEP): ...in Units (x): Rs. x = (FC / CM) ...in Sales Rs. : Rs. x = (FC / CM)\* S ...in % of Capacity : BEP in Units/PC × 100% \* At Break Even, Net Profit or Loss = 0 Scenario 1 Summary

Selling price per unit = S = 50 RsFixed Costs per period = FC = Rs. 8640 Variable Costs = VC = Rs. 30 per unit. Production Capacity per period = PC = 900 units

Solution of this problem is in the next lecture.

# LECTURE 21 PERFORM LINEAR COST-VOLUME PROFIT AND BREAK-EVEN ANALYSIS USING THE CONTRIBUTION MARGIN APPROACH

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 18
- Perform Break-Even Analysis
- MS EXCEL Financial Functions
- •

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 20
- Perform linear cost-volume profit and break-even analysis.
- Using the contribution margin approach

# **SCENARIO 1**

Contribution Margin per unit = CM = S - VC = 50 - 30 = 20 Rs. Contribution rate =  $CR = CM/S \times 100\% = Rs$ . 20/50×100% = 40%

## Break Even Point:

**In Units**, x = FC / CM = 8640/20 = 432 Units **In Rs**,  $x = (FC / CM)^* S =$ (Rs. 8640/Rs.20)\* Rs.50 = Rs.21,600 **% of Capacity =** BEP in units/ PC ×100% = 432/ 900×100% = 48% Thus by selling more than 432 units of its new product, a firm can make profit.

# **SCENARIO 2**

The Lighting Division of A Lighting Fitting Manufacturer plans to introduce a new street light based on the following accounting information: FC per period = Rs. 3136

VC = Rs.157 per unit

S= Rs.185 per unit

Production Capacity per period = 320 units

Calculate the break even point (BEP)

...in units

...in rupees

...as a percent of capacity

# Break Even Point

<u>...in units</u> = FC / CM CM = S – VC = Rs.185 – 157 = Rs.28 BEP in units = 3136/28 = 112 Units

# Break Even Point

<u>...in Rupees</u> = (FC / CM)\* S = (3136/28) \* 185 = 20720 Rs.

# Break Even Point

...as a percent of capacity = BEP in units/PC×100%

= 112/320×100% = 35% Capacity

# SCENARIO 2-1

FC = Rs.3136 VC = Rs.157per unit S= Rs.185 per unit Production Capacity = 320 units Determine the BEP as a % of capacity if FC are reduced to Rs.2688. Formula: BEP as a % of capacity = BEP in units/PC×100% Step 1... Find CM Step 2... Find BEP in units Step 3... Find % of Capacity Step 1... Find CM per unit S = 185Rs per unit VC = 157Rs per unit CM = S – VC = 185 – 157 = Rs. 28 Step 2... Find BEP in units BEP in units = FC/CM = Rs. 2688/ Rs.28 = 96 Units Step 3... Find % of Capacity BEP as a % of capacity = BEP in units / PC×100% = 96/320×100% = 30% of Capacity **SCENARIO 2-2** FC = Rs.3136 VC = Rs.157 per unit S = Rs.185 per unit Production Capacity = 320 units per period Determine the BEP as a % of capacity if FC are increased to Rs.4588, and VC reduced to 80% of S. BEP as a % of capacity = BEP in units/PC×100% New VC = S × 80% = 185 × 0.8 = Rs.148 New FC = 4588 Rs

# Step 1... Find CM per unit S = 185 Rs per unit VC = 148Rs per unit CM = S - VC = Rs. 37Step 2... Find BEP in units BEP in units = FC/CM = Rs. 4588 / Rs. 37 = 124 Units Step 3... Find % of Capacity BEP as a % of capacity = BEP in units /PC×100% = 124/320×100% = 39% of Capacity SCENARIO 2 -3 FC = Rs. 3136 VC = Rs.157 per unit S= Rs.185 per unit Production Capacity = 320 units per period Determine the BEP as a % of capacity if S is reduced to Rs.171. BEP as a % of capacity = BEP in units/PC×100% Step 1... Find CM per unit S = 171Rs per unit VC = 157Rs per unit CM = S - VC = Rs. 14Step 2... Find BEP in units BEP in units = FC/CM = Rs. 3136/ Rs. 14 = 224 Units Step 3... Find BEP as a % of Capacity BEP as a % of capacity = BEP in units /PC×100% = 224/320×100% = 70 % of Capacity

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 21
- Perform Linear Cost-Volume Profit and Break-Even analysis.
- Using Microsoft Excel

# <u>SCENARIO 1</u>

Let us look at different scenarios for calculation of contribution margin and net profit. The explanations are given in the slides.

The Break Even Point in Rs. is 21,600. The break Even point as a % of capacity is 48%.

# Net loss

Net loss=NL=Number of units sale below BEP in units × Contribution Margin per unit

# Alternatively,

Negative sign with Net Income means Net loss. That is Net loss = - Net Income. Number of units sale below BEP in units = - Number of units sale above BEP in units Thus Net loss= - Net income= - Number of units sale above BEP in units×Contribution Margin per unit

# SCENARIO 2-6

FC = Rs. 3136 VC = Rs.157 S= Rs.185 Capacity = 320 units Find the number of units sold if there is a Net Loss (NL) of Rs. 336?

# <u>Formula</u>

Net loss = Number of units sale below BEP in units × Contribution Margin per unit Number of Units below BEP in units = (NL)/CM

# Step 1... Find CM per unit

S = 185 Rs per unitVC = <u>-157 Rs per unit</u> CM = 28 Rs (CM of Rs.28 per unit)

# Step 2... Find BEP in units

BEP in units = FC/CM = Rs. 3136/ Rs. 28 = 112 Units

# Step 3... Find units below BEP=NL/CM

Number of unit sales below BEP = Rs. 336/Rs. 28 per Unit

Hence:

= 12 Units

Total Sold Units = BEP in units – Number of units sale below BEP =112 - 12 = 100

# Alternate Method

Net loss= - Net income= - Number of units sale above BEP in units×Contribution Margin per unit

Number of units sale above BEP in units = <u>- Net loss</u> Contribution Margin per unit

= -336 / 28 = -12Total sold units = BEP in units + Number of units sale above BEP in units = 112 + (-12) = 100

# SCENARIO 2-7

FC = Rs. 3136 VC = Rs.157per unit S= Rs.185 per unit Production Capacity = 320 units The company operates at 85% of its capacity. Find the Profit or Loss.

## **Formula**

Number of units above BEP in units × CM = NI

# Step 1... Find CM per unit

S = 185 Rs per unit VC =  $-\frac{157}{157}$  Rs per unit CM = Rs. 28 (CM of Rs.28 per unit)

# Step 2... Find BEP in units

BEP in units = FC/CM = Rs. 3136/ Rs. 28 = 112 Units

# Step 3... Find units over BEP

Units produced = 320\*0.85 = 272 Units BEP in units = 112 units Number of units over BEP in units = 272 – 112 = 160 Hence: Net income =NI = 160 Units \* 28 = 4480 Rs.

# LECTURE 23 STATISTICAL DATA REPRESENTATION

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 22
- Statistical Data Representation.

# MODULE 5

Statistical data representation (Lecture 23) Measures of central tendency (Lectures 24-25) Measures of dispersion and skewness (Lectures 26-27) MODULE 6 Correlation (Lecture 28-29) Line Fitting (Lectures 30-31) Time Series and Exponential Smoothing (Lectures 32-33) MODULE 7 Factorials Permutations and Combinations (Lecture 34) Elementary Probability (Lectures 35-36) Chi-Square (Lectures 37) **Binomial Distribution** (Lectures 38) MODULE 8 Patterns of probability: Binomial, Poisson and Normal Distributions (Lecture 39-41) Estimating from Samples: Inference (Lectures 42-43) Hypothesis testing: Chi-Square Distribution (Lectures 44-45) End-Term Examination

# STATISTICAL DATA

Information is collected by government departments, market researchers, opinion pollsters and others. Information then has to be organized and presented in a way that is easy to understand

## **BASIS FOR CLASSIFICATION**

- 1. Qualitative: Attributes: sex, religion
- 2. Quantitative Characteristics: Heights, weights, incomes etc.
- 3. Geographical: Regions: Provinces, divisions etc.
- 4. Chronological or Temporal
- 5. By time of occurrence: Time series

# TYPES OF CLASSIFICATION

There are different types of classifications.

- One-way
- One characteristic: Population
- Two-way Two characteristics at a time
- Three-way Three characteristics at a time

# **METHODS OF PRESENTATION**

- Different methods of representation are:
- Text

- "The majority of population of Punjab is located in rural areas."
- Semi tabular
- Data in rows
- Tabular
- Tables with rows and columns
- Graphic
- Charts and graphs

# **TYPES OF GRAPHS**

- Picture graph
- Column Graphs
- Line Graphs
- Circle Graphs (Sector Graphs)
- Conversion Graphs
- Travel Graphs
- Histograms
- Frequency Polygon
- Cumulative -Polygon or Ogive

# PICTURE GRAPH or PICTOGRAPH

In picture graph or pictograph, each value is represented by a proportional number of pictures. In the example below, one car represents 10

cars

## SECTOR GRAPHS

Sector graphs use the division of a circle into different sectors. The full circle is 360 degrees. For each percentage, degees are calculated and sectors plotted.

# **Example of Sector Graph**

**COLUMN AND BAR GRAPHS** 

The following slide gives the Proportion of households by size in the form of a Column and Bar graph.

# COLUMN AND BAR

# Proportion of households by size

# LINE GRAPHS

Line graphs are the most commonly used graphs. A line graph plots data as points and then joins them with a line.

# **Example**

# **Time Needed to Locate Suitable Library Materials**

# LECTURE 24 STATISTICAL REPRESENTATION MEASURES OF CENTRAL TENDENCY PART 1

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 18
- Statistical Representation
- Measures of Central Tendency

# LINE GRAPHS

Line graphs are the most commonly used graphs. In the following graph, you can see the occurrence of causes of death due to cancer in males and females. You can see that after the age of 40, the occurrence of cancer is much greater in the case of males. The line graph of heart diseases also shows that the disease is more prominent in the case of males.

As you see line graphs help us to understand the trends in data very clearly.

Another line graph of temperature in 4 cities A, B, C and D shows that although the general pattern is similar, the temperature in city A is lowest followed by D, B and C. In city C the highest temperature is close to 30 whereas in city A and B it is about 25. The highest temperature in city D is about 28 degrees.

# LINE GRAPHS

# Central Tendency

The term central tendency refers to the middle value (sometime a typical value) of the data.

Measures of central tendency are measures of the location of the middle or the center of a distribution. The "Mean" is the most commonly used measure of central tendency.

# MEAN

Also known as the arithmetic mean, the mean is typically what is meant by the word average. The mean is perhaps the most common measure of central tendency. The mean of a variable is given by

(the sum of all its values)/(the number of values). For example, the mean of 4, 8, and 9 is (4+8+9)/3 = 7

# Example:

58 69 73 67 76 88 91 and 74 (8 marks). **Sum** = 596 **Mean** = 596/8 = 74.5 Please note that the mean is affected by extreme values.

# <u>MEDIAN</u>

Another typical value is the median. To find the median of a number of values first arrange the data in ascending or descending order then locate the middle value, , If there are odd number of data points then median is the middle values. If there are even number of data points then median is mean of the two middle values.

Median is easier to find than the mean, and unlike the mean it is not affected by values that are unusually high or low

Example: 3 6 11 14 19 19 21 24 31 (9 values) In the above data there are 9 values. So, median is The middle value i-e 19.

# MODE

The most common score in a set of scores is called the mode. There may be more than one mode, or no mode at all 2212032114111220321 The mode, or most common value, is 1.

	Description/Explanation	Advantages	Disadvantages	
Mean	the sum of all the results included in the sample divided by the number of observations	Quick and easy to calculate	May not be representative of the whole sample	
Median	the middle value of all the numbers in the sample.	Takes all numbers into account equally	More tedious to calculate than the other two Can be affected by a few very large (or very small) numbers	
Mode	<ul> <li>the most frequently observed value of the measurements in the sample. There can be more than one mode or no mode.</li> <li>for an even number of values, the median is the average of the middle two values</li> <li>for an odd number of values, the median is the middle of the all of the values.</li> </ul>	Fairly easy to calculate Half of the sample (normally) lies above the median	Tedious to find for a large sample which is not in order	

# **ORGANISING DATA**

There are many different ways of organizing data.

# **Organizing Numerical Data**

# **Organizing Numerical Data**

Numerical data can be organized in any of the following forms:

- The Ordered Array and Stem-leaf Display
- Tabulating and Graphing Numerical Data
- Frequency Distributions: Tables, Histograms, Polygons
- Cumulative Distributions: Tables, the Ogive

# Stem and Leaf Display

A stem and leaf display (also called a stem and leaf plot) is particularly useful when the data is not too numerous.

Since  $21 = 20 + 1 = (10 \times 2) + 1$ 

This is represented in the plot as a stem of 2 and a leaf of 1. The digit at the tenth place is taken as stem and the digit at units place is taken as leaf. Similarly, 26 is represented in the plot as a stem of 2 and a leaf of 6.

Remember, a stem is displayed once and the leaf can take on the values from 0 to 9.

# <u>Example</u>

Consider Figure 1. It shows the number of touchdown (TD) passes thrown by each of the 31 teams in the National Football League in the 2000 season.

37, 33, 33, 32, 29, 28, 28, 23, 22, 22, 22, 21, 21, 21, 20, 20, 19, 19, 18, 18, 18, 18, 16, 15, 14, 14, 14, 12, 12, 9, 6 Figure 1: Number of touchdown passes.

A stem and leaf display of the data is shown in the Table 1 below. The left portion of the table contains the stems. They are the numbers 3, 2, 1, and 0, arranged as a column to the left of the bars. (As in 34, 3 is stem and 4 is leaf. In 16, 1 is stem and 6 is leaf)

Stem and leaf display showing the number of passing touchdowns.

# Table 1

To make this clear, let us examine this Table 1 more closely. In the top row, the four leaves to the right of stem 3 are 2, 3, 3, and 7. Combined with the stem, these leaves represent the numbers 32, 33, 33, and 37, which are the numbers of TD passes for the first four teams in the table. The next row has a stem of 2 and 12 leaves. Together, they represent 12 data points. We leave it to you to figure out what the third row represents. The fourth row has a stem of 0 and two leaves.

One purpose of a stem and leaf display is to clarify the shape of the distribution. You can see many facts about TD passes more easily in Figure 1 than in the Table 1. For example, by looking at the stems and the shape of the plot, you can tell that most of the teams had between 10 and 29 passing TDs, with a few having more and a few having less. The precise numbers of TD passes can be determined by examining the leaves.

# Tabulating and Graphing Univariate Categorical Data

There are different ways of organizing univariate categorical data:

- The Summary Table
- Bar and Pie Charts, the Pareto Diagram

# Tabulating and Graphing Bivariate Categorical Data

Bivariate categorical data can be organized as :

- •
- **Contingency Tables** Side by Side Bar charts

# **GRAPHICAL EXCELLENCE AND COMMON ERRORS IN PRESENTING DATA**

It is important that data is organized in a professional manner and graphical excellence is achieved in its presentation. High quality and attractive graphs can be used to explain and highlight facts which otherwise may go unnoticed in descriptive presentations. That is why all companies in their annual reports use different types of graphs to present data.

# **TABULATING NUMERICAL DATA:**

## Group data into classes

In some cases it is necessary to group the values of the data to summarize the data properly.

The process is described below. Step 1: Sort Raw Data in Ascending Order 12, 13, 17, 21, 24, 24, 26, 27, 27, 30, 32, 35, 37, 38, 41, 43, 44, 46, 53, 58 Data:

# Step 2: Find Range

Range = Maximum value – Minimum Value Thus, Range = 58 - 12 = 46

# **Step 3: Select Number of Classes**

Select the number of classes. (The classes are usually selected between 5 and 15) In our example let us make 5 classes.

# Step 4: Compute Class (width)

Find the class width by dividing the range by the number of classes and rounding up. Be careful of two thinas.

- a) You must *round up*, not off. Normally 3.2 would round to be 3, but in rounding up, it becomes 4.
- b) If the range divided by the number of classes gives an integer value (no remainder), then you can either add one to the number of classes or add one to the class width.

In our example

Class width = Range 46 = 9.2Number of classes 5

Round up 9.2 to 10

# Step 5: Determine Class Boundaries (limits)

Pick a suitable starting point less than or equal to the minimum value. You will be able to cover, "the class width times the number of classes", values. Your starting point is the lower limit of the first class. Continue to add the class width to this lower limit to get the lower limit of other classes.

In this example if we start with 10 we will cover  $10 \times 5 = 50$  values, which is close to our range. So let 10 be the lower limit of the first class. Continue to add 10 to this lower limit to get the lower limit of other classes.

: 10, 20(=10+10), 30(=20+10), 40(=30+10), 50(=40+10)

To find the upper limit of the first class, subtract one from the lower limit of the second class. Then continue to add the class width to this upper limit to find the rest of the upper limits

Upper limit of first class is 20 - 1 = 19.

Rest upper limits are; 29 (=19+10), 39 (=29+10), 49 (=39+10)

# Step 6: Compute Class Midpoints

Class Midpoint = <u>(Lower limit + Upper limit)</u> 2

First midpoint is (10+19)/2 = 14.5

Other midpoints are: (20+29)/2 = 24.5 (30+39)/2 = 34.5 (40+49)/2) = 44.5 (50+59)/2) = 54.5

Depending on what you're trying to accomplish, it may not be necessary to find the midpoint.

# Step 7: Compute Class Intervals

First class : Lower limit is 10. Higher limit is 19. We can write first class interval as **10 to 19** or **10 – 19** or "**10 but under 20**". In "**10 but under 20**" a value greater than 19.5 will be treated as above 20.

Similarly other 4 class intervals are

- 20 29
- 30 39
- 40 49
- 50 59

# Important points to remember

- 1. There should be between 5 and 15 classes.
- 2. Choose an odd number as a class width if you want to have classes' midpoints as an integer instead of decimals.
- 3. The classes must be mutually exclusive. This means that no data value can fall into two different classes
- 4. The classes must be all inclusive or exhaustive. This means that all data values must be included.
- 5. The classes must be continuous. There should be no gaps in a frequency distribution. Classes that have no values in them must be included (unless it's the first or last class (es) that could be dropped).
- 6. The classes must be equal in width. The exception here is the first or last class. It is possible to have a "below ..." as a first class or "... and above" as a last class.

# Frequency Distribution: Count Observations & Assign to Class Intervals:

Looking through the data shows that there are three values between 10 and 19. Hence frequency is 3. Similarly, frequency of other class intervals can be found as follows: 10 - 19: 3

20 - 29 : 6 30 - 39 : 5 40 - 49 : 4 50 - 59 : 2 Total frequency = 3 + 6 + 5 + 4 + 2 = 20

<u>Relative frequency :</u> Relative Frequency of a class = <u>Frequency of the class interval</u> Total Frequency

There are 3 observations in first class interval 10 - 19. The relative frequency is 3/20 = 0.15. Similarly relative frequency for other class intervals are calculated.

# Percent Relative Frequency:

If we multiply 0.15 by 100, then the % Relative Frequency 15% is obtained.

TABULATING NUMERICAL DATA FREQUENCY DISTRIBUTIONS Data in ordered array								
Class	Frequency	Relative Frequency	% Relative Frequency					
10 but under 20	3	.15	15					
20 but under 30	6	.30	30					
30 but under 40	5	.25	25					
40 but under 50	4	.20	20					
50 but under 60	2	,10	10					
Total	20	1	100					

# Cumulative Frequency:

If we add frequency of the second interval to the frequency of the first interval, then the cumulative frequency for the second interval is obtained. Cumulative frequency of each class interval is calculated below.

10 - 19 : 3 20 - 29 : 3 + 6 = 9 30 - 39 : 3 + 6 + 5 = 14 40 - 49 : 3 + 6 + 5 + 4 = 1850 - 59 : 3 + 6 + 5 + 4 + 2 = 20

# Percent cumulative relative frequency

This can be calculated same as cumulative frequency except now percent relative frequency for each class interval is considered. The percent cumulative relative frequency of the last class interval is 100% as all observations have been added. Percent cumulative relative frequency of each class interval is calculated below 10 - 19: 1520 - 29: 15 + 30 = 4530 - 40: 15 + 30 + 25 = 7040 - 50: 15 + 30 + 25 + 20 = 9050 - 60: 15 + 30 + 25 + 20 + 10 = 100

## LECTURE 25 STATISTICAL REPRESENTATION MEASURES OF CENTRAL TENDENCY PART 2

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 24
- Statistical Representation
- Measures of Central Tendency

# Part 2 GRAPHING NUMERICAL DATA: THE HISTOGRAM

Histogram is a bar graph of a frequency distribution in which the widths of the bars are proportional to the classes into which the variable has been divided and the heights of the bars are proportional to the class frequencies. Histogram of the example of frequency distribution discussed at the end of lecture 24 is given below.

# GRAPHING NUMERICAL DATA: THE HISTOGRAM

Class Midpoints

# MEASURES OF CENTRAL TENDENCY

Measures of central tendency can be summarized as under:

- 1. Arithmetic Mean
  - a. Arithmetic mean for discrete data
    - i. Sample Mean
    - ii. Population Mean
  - b. Arithmetic Mean for grouped data
- 2. Geometric Mean
- 3. Harmonic Mean
- 4. Weighted Mean
- 5. Truncated Mean or Trimmed Mean
- 6. Winsorized Mean
- 7. Median

- a. Median for grouped data
- b. Median for discrete data
- 8. Mode
  - a. Mode for grouped data
  - b. Mode for discrete data
- 9. Midrange
- 10. Midhinge

As you see it is a long list. However, if you look closely you will find that the main measures are Arithmetic Mean, Median, Mode.

All the above measures are used in different situations to understand the behavior of data for decision making. It may be interesting to know the average, median or mode salary in an organization before the company decides to increase the salary level. Comparisons with other companies are also important. The above measures provide a useful summary measure to consolidate large volumes of data. Without such summaries it is not possible to compare large selections of data.

EXCEL has a number of useful functions for calculating different measures of central tendency. Some of these are explained below. You are encouraged to go through EXCEL Help file for detailed descriptions of different functions. For selected functions, the help file has been included in the handouts. The examples are also from the help files.

# AVERAGE

Returns the average (arithmetic mean) of the arguments.

# Syntax

AVERAGE(number1,number2,...)

Number1, number2, ... are 1 to 30 numeric arguments for which you want the average. **<u>Remarks</u>** 

- The arguments must either be numbers or be names, arrays, or references that contain numbers.
- If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value zero are included

# **Example**

An example of AVERAGE is shown below. Data was entered in cells A4 to A8. The formula was =AVERAGE(A4:A8). The 11 is shown in cell A10.

172

# **AVERAGEA**

Calculates the average (arithmetic mean) of the values in the list of arguments. In addition to numbers, text and logical values such as TRUE and FALSE are included in the calculation.

# Syntax

AVERAGEA(value1,value2,...)

Value1, value2, ... are 1 to 30 cells, ranges of cells, or values for which you want the average.

# **Remarks**

• The arguments must be numbers, names, arrays, or references.

• Array or reference arguments that contain text evaluate as 0 (zero). Empty text ("") evaluates as 0 (zero). If the calculation must not include text values in the average, use the AVERAGE function.

• Arguments that contain TRUE evaluate as 1; arguments that contain FALSE evaluate as 0 (zero).

7

Formula	Description (Result)
=AVERAGEA(A2:A6)	Average of the numbers above, and the text "Not Available". The cell with the text "Not available" is used in the calculation. (5.6)
=AVERAGEA(A2:A5,A7)	Average of the numbers above, and the empty cell. (7)

# <u>MEDIAN</u>

Returns the median of the given numbers. The median is the number in the middle of a set of numbers; that is, half the numbers have values that are greater than the median, and half have values that are less.

# Syntax

MEDIAN(number1,number2,...)

Number1, number2, ... are 1 to 30 numbers for which you want the median.

<u>Remarks</u>

- The arguments should be either numbers or names, arrays, or references that contain numbers. Microsoft Excel examines all the numbers in each reference or array argument.
- If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value zero are included.
- If there is an even number of numbers in the set, then MEDIAN calculates the average of the two numbers in the middle. See the second formula in the example.

## **Example**

The numbers are entered in cells A14 to A19.

In the first formula =MEDIAN(1,2,3,4,5) the actual values are specified. The median as you see is 3, in the middle.

In the next formula =MEDIAN(A14:A19), the entire series was specified. There is no middle value in the middle. Therefore the average of the two values 3 and 4 in the middle was used as the median 3.5.

22										

# MODE

Returns the most frequently occurring, or repetitive, value in an array or range of data. Like MEDIAN, MODE is a location measure.

# Syntax

# MODE(number1,number2,...)

Number1, number2, ... are 1 to 30 arguments for which you want to calculate the mode. You can also use a single array or a reference to an array instead of arguments separated by commas.

# **Remarks**

- The arguments should be numbers, names, arrays, or references that contain numbers.
- If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value zero are included.
- If the data set contains no duplicate data points, MODE returns the #N/A error value. In a set of values, the mode is the most frequently occurring value; the median
- is the middle value; and the mean is the average value. No single measure of central tendency provides a complete picture of the data. Suppose data is clustered in three areas, half around a single low value, and half around two large values. Both AVERAGE and MEDIAN may return a value in the relatively empty middle, and MODE may return the dominant low value.

## Example

The data was entered in cells A27 to A32. The formula was =MODE(A27:A32). The answer 4 is the most frequently occurring value.

# **COUNT FUNCTION**

Counts the number of cells that contain numbers and also numbers within the list of arguments. Use COUNT to get the number of entries in a number field that's in a range or array of numbers.

# Syntax

# **COUNT**(value1,value2,...)

Value1, value2, ... are 1 to 30 arguments that can contain or refer to a variety of different types of data, but only numbers are counted.

# Remarks

- Arguments that are numbers, dates, or text representations of numbers are counted; arguments that are error values or text that cannot be translated into numbers are ignored.
- If an argument is an array or reference, only numbers in that array or reference are counted. Empty cells, logical values, text, or error values in the array or reference are ignored. If you need to count logical values, text, or error values, use the COUNTA function.

# <u>Example</u>

	Α
1	Data
2	Sales
3	12/8/2008
4	
5	19
6	22.24
7	TRUE

8	#DIV/0!	
	Formula	Description (Result)
	=COUNT(A2:A8)	Counts the number of cells that contain numbers in the list above (3)
	=COUNT(A5:A8)	Counts the number of cells that contain numbers in the last 4 rows of the list (2)
	=COUNT(A2:A8,2)	Counts the number of cells that contain numbers in the list, and the value 2 (4)

# FREQUENCY

**Calculates how often values occur within a range of values, and then returns a vertical array of numbers. For example**, use FREQUENCY to count the number of test scores that fall within ranges of scores.

**Remember** FREQUENCY returns an array, it must be entered as an array formula. **Syntax** 

# FREQUENCY(data\_array,bins\_array)

Data\_array is an array of or reference to a set of values for which you want to count frequencies. If data\_array contains no values, FREQUENCY returns an array of zeros. Bins\_array is an array of or reference to intervals into which you want to group the values in data\_array. If bins\_array contains no values, FREQUENCY returns the number of elements in data\_array.

# **Remarks**

- FREQUENCY is entered as an array formula after you select a range of adjacent cells into which you want the returned distribution to appear.
- The number of elements in the returned array is one more than the number of elements in bins\_array. The extra element in the returned array returns the count of any values above the highest interval. For example, when counting three ranges of values (intervals) that are entered into three cells, be sure to enter FREQUENCY into four cells for the results. The extra cell returns the number of values in data\_array that are greater than the third interval value.
- FREQUENCY ignores blank cells and text.
- Formulas that return arrays must be entered as array formulas.

	Α	В
1	Scores	Bins
2	79	70
3	85	79
4	78	89
5	85	
6	50	
7	81	
8	95	
9	88	
10	97	

Formula =FREQUENCY(A2:A1 0,B2:B5)

# Description (Result)

Number of scores less than or equal to 70 (1) Number of scores in the bin 71-79 (2) Number of scores in the bin 80-89 (4) Number of scores greater than or equal to 90 (2)

# Example

**Note** The formula in the example must be entered as an array formula. After copying the example to a blank worksheet, select the range A13:A16 starting with the formula cell. Press F2, and then press CTRL+SHIFT+ENTER. If the formula is not entered as an array formula, the single result is 1.

# ARITHMETIC MEAN GROUPED DATA

Below is an example of calculating arithmetic mean of grouped data. Here the marks (Classes) and frequency are given. The class marks are the class mid points calculated as average of lower and higher limits. For example, the average of 20 and 24 is 22. The frequency f is multiplied by the class mark to obtain the total number. In first row the value of fx is 1 x 22 = 22. The sum of all fx is 1950. The total number of observations is 50. Hence the arithmetic mean is 1950/50 = 39.

Marks	Frequency	Class Marks	fX	
20-24	1	22	22	
25-29	4	27	108	
30-34	8	32	256	
35-39	11	37	407	
40-44	15	42	630	
45-49	9	47	423	
50-54	2	52	104	
TOTAL	50		1950	

n= 50; Sum(fX) =1950; Mean =1950/50= 39 Marks

# EXCEL Calculation

The above calculation would be common in business life. Let us see how we can do it using EXCEL.

The basic data of lower limits is entered in cell range A54:A60. The data of higher limit is entered in cells B54:B60. Frequency is given in cell range D54:D60. Class midpoints or class marks were calculated in cells F54:F60. In cell F54 the formula =(A54+B54)/2 was used to calculate the class mark. This formula was copied in other cells (F55 to F60). The value of fx was calculated in cell H54 using the formula =D54\*F54. This formula was copied to other cells H55 to H60. Total frequency was calculated in cell D61 using the formula =SUM(D54:D60). Sum of fx was calculated in cell H61 using the formula =SUM(H54:H60). Mean was calculated in cell H62 using the formula =ROUND(H61/D61,0).

# LECTURE 26 STATISTICAL REPRESENTATION MEASURES OF DISPERSION AND SKEWNESS PART 1

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 25
- Statistical Representation
- Measures of Dispersion and Skewness

# FREQUENCY-EXAMPLE

FREQUENCY Function calculates how often values occur within a range of values, and then returns a vertical array of numbers. For details see handout for lecture 25. The syntax is **FREQUENCY**(data\_array,bins\_array).

<b>X</b> I	hicroso	oft Exc	el - Frequ	ency												- 7 🛛

10		88		2												
11		97														

The data was entered in cells A3 to A11. The Bins array which gives the limits 70, 79 and 89 were entered in cells B3 to B5. Select cells BC7 to BC10 (one more than the limits) Type the formula =FREQUENCY(A3:A1,B3:B5) Then, CTRL+Shift+Enter were pressed to indicate that we are entering an array formula.

The result is given in cells B7 to B10. We can interpret the result as the frequency of It Less than or equal to 70 is 1

71 to 79 is 2 80 to 88 is 4 89 and above is 2

# Application of FREQUENCY function in Frequency Distribution

Consider the example at the end of lecture 24.
FREQU D 12, 13, 17, 21, 24, 24,	ENCY DI ata in order 26, 27, 27, 30, 32	STRIBU red array	JTIONS
Class	Frequency	Relative Frequency	% Relative Frequency
10 but under 20	3	.15	15
20 but under 30	6	.30	30
30but under 40	5	.25	25
40 but under 50	4	.20	20
50 but under 60	2	.10	10
Total	20	1	100

Let us find Frequency distribution using Excel function FREQUENCY.

🛛 Microsoft Excel - Book1					
:1	<u>Eile E</u> dit	<u>V</u> iew <u>I</u> ns	ert F <u>o</u> rmat <u>T</u> oo	ls <u>D</u> ata <u>W</u> in	dow <u>H</u> elp
En	pi 🖂 🛛		a 🥙 🛍 🐰	🗈 🖹 • 🛷	'  <b>≥</b> ) → (≥  →   😣
	-				
An	ai	- IU	• B 1 U		±≝ \$%''.
	E24	•	fx		
	A	В	C	D	E
1	Data		Clas	SS	Frequency

14	37				
15	38				
16	41				
17	43				
18	44				
19	46				
20	53				
21	58				

Write data in column A. In column C and D write the class's lower and upper limits. Here we will take class's upper limit as bins. Select the cells E3 to E8, under Frequency heading (one cell more than the number of classes). Type =FREQUENCY(A2:A21,D3:D7). Press Ctrl+Shift+Enter. Your Frequency column will get filled with above mentioned values.

#### FREQUENCY POLYGONS

Frequency polygon is a line graph obtained from a frequency distribution by joining with straight lines points, whose abscissa are the midpoints of successive class intervals and whose ordinates are the corresponding class frequencies.

#### CUMULATIVE FREQUENCY

Relative frequency can be converted into cumulative frequency by adding the current frequency to the previous total. In the slide below, the first interval has the relative as well as cumulative frequency as 3. In the next interval the relative frequency was 6. it was added to the previous value to arrive at 9 as cumulative frequency for interval 20 to 30. What it really means is that 9 values are equal to or less than 30. Similarly, the other cumulative frequencies were calculated. The total cumulative frequency 20 is the total number of observations.

Percent Cumulative frequency is calculated by dividing the cumulative frequency by the total number of observations and multiplying by 100. For the first interval the % cumulative frequency is 3/20\*100 = 15%. Similarly other values were calculated.

#### TABULATING NUMERICAL DATA: CUMULATIVE FREQUENCY Data in ordered array

12, 13, 17, 21, 24, 24, 26, 27, 27, 30, 32, 35, 37, 38, 41, 43, 44, 46, 53, 58

	Cumulative	, % Cumulative
Class	Frequency	Relative Frequency
10 but under 20	3	15
20 but under 30	9	45
30 but under 40	14	70
40 but under 50	18	90
50 but under 60	20	100

#### CUMULATIVE % POLYGON-OGIVE

From the % cumulative relative frequency polygon that starts from the first limit (not mid point as in the case of relative frequency polygons) can be drawn. Such a polygon is called Ogive. The maximum value in an Ogive is always 100%. Ogives are determining cumulative frequencies at different values (not limits).

### **GRAPHING NUMERICAL DATA:**

THE OGIVE (CUMULATIVE % POLYGON) Data in ordered array

12, 13, 17, 21, 24, 24, 26, 27, 27, 30, 32, 35, 37, 38, 41, 43, 44, 46, 53, 58

Class Boundaries (Not Mid points)

#### TABULATING AND GRAPHING UNIVARIATE DATA

Univariate data (one variable) can be tabulated in Summary form or in graphical form. Three types of charts, namely, Bar Charts, Pie Charts or Pareto Diagrams can be prepared.

#### SUMMARY TABLE

÷

A summary table is built specifically from detailed data. It contains summaries of the data and is used to speed up analysis.

A typical Summary Table for an investor's portfolio is given in the slide. The variables such as stocks etc. are the categories. The table shows the amount and percentage.

Investment Category	Amount(in thousand Rs)	Percentage
Stocks	46.5	42.27
Bonds	32	29.09
Cash	15.5	14.09
Deposit		
Savings	16	14.55
TOTAL	110	100

#### BAR CHART

The data of Investor's portfolio can be shown in the form of Bar Chart as shown below. This chart was prepared using EXCEL Chart Wizard. The Wizard makes it very simple to prepare such graphs. You must practice with the Chart Wizard to prepare different types of graphs.

# BAR CHART (FOR AN INVESTOR'S PORTFOLIO)

#### PIE CHARTS

Pie Charts are very useful charts to show percentage distribution. These charts are made with the help of Chart Wizard. You may notice how Stocks and bonds stand out.

# (FOR AN INVESTOR'S PORTFOLIO)

#### PARETO DIAGRAMS

A Pareto diagram is a cumulative distribution with the first value as first relative frequency, in this case 42%. The point is drawn in the middle of bar for the first category stocks. Next the category Bonds was added. The total is 71%. Next the savings 15% were added to 71% to obtain cumulative frequency 86%. Adding the 14% for CD gives 100%. Thus, the Pareto diagram gives both relative and cumulative frequency.

#### **CONTINGENCY TABLES**

Another form of presentation of data is the contingency table. An example is shown in the slide below. The table shows a comparison of three investors along with their combined total investment.

### TABULATING CATEGORICAL DATA: BIVARIATE DATA

#### Contingency Table

Investment in Thousands of Rupees				
Investment Category	Investor A	Investor B	hvestor C	Total
Stocks	46.5	55	27.5	129
Bonds	32	44	19	95
CD	15.5	20	13.5	49
Savings	16	28	7	51
Total	110	147	67	324

#### SIDE BY SIDE CHARTS

The same investor data can be shown in the form of side by side charts where different colours were used to differentiate the investors. This graph is a complete representation of the contingency table.

### GRAPHING CATEGORICAL DATA: BIVARIATE DATA

#### **GEOMETRIC MEAN**

Geometric mean is defined as the root of product of individual values. Typical syntax is as under: G=(x1.x2.x3....xn)^(1/n) Example Find GM of 130, 140, 160

Find GM of 130, 140, 160 GM = (130\*140\*160) ^ (1/3) = 142.8

#### HARMONIC MEAN

Harmonic mean is defines as under:  $HM = \underbrace{n}_{(1/x1+1/x2+....1/xn)} = \underbrace{n}_{Sum(1/xi)}$ 

#### **Example**

Find HM of 10, 8, 6 HM =  $\frac{3}{(1/10+1/8+1/6)}$  = 7.66

#### **QUARTILES**

Quartiles divide data into 4 equal parts **Syntax** 1st Quartile Q1=(n+1)/42nd Quartile Q2= 2(n+1)/43rd Quartile Q3= 3(n+1)/4 **Grouped data** Qi= ith Quartile = 1 + h/f[Sum f/4\*i - cf) I = lower boundary h = width of CIcf = cumulative frequency

#### **DECILES**

Deciles divide data into 10 equal parts **Syntax** 1st Decile D1=(n+1)/10 2nd Decile D2= 2(n+1)/109th Deciled D9= 9(n+1)/10 **Grouped data** Qi = ith Decile (i=1,2,.9) = I + h/f[Sum f/10\*i - cf) I = lower boundary h = width of CI cf = cumulative frequency

#### PERCENTILES

Percentiles divide data into 100 equal parts **Syntax** 1st Percentile P1=(n+1)/100 2nd Decile D2= 2(n+1)/10099th Deciled D9= 99(n+1)/100 **Grouped data** Qi = ith Decile(i=1,2,.9) = I + h/f[Sum f/100\*i - cf) I = lower boundary h = width of CI cf = cumulative frequency

#### **Symmetrical Distribution**

mean = median = mode
Positively Skewed Distribution
(Tilted to left)
mean > median > mode
Negatively Skewed Distribution
mode < median < mean
(Tilted to right)
EMPIRICAL RELATIONSHIPS
Moderately Skewed and Unimodal Distribution
Mean - Mode = 3(Mean - Median)
Example
mode = 15, mean = 18, median = ?
Median = 1/3[mode + 2 mean]
= 1/3[15 + 2(18)]
= [15+36]/3 = 51/3 = 17</pre>

**A trimmed or truncated mean** is a measure of central tendency and is one type of modified mean. In this, first we sort the data. Then according to the problem, discard an equal number of data at both ends. Most often 25 percent of the ends are discarded. That is, values below first quartile and above third quartile are removed. Mean of the remaining data is called trimmed mean or truncated mean.

#### WINSORIZED MEAN

It involves the calculation of the mean after replacing given parts of a data at the high and low end with the most extreme remaining values. Most often 25 percent of the ends are replaced. That is, values below first quartile and above third quartile are replaced.

#### Example

Find trimmed and winsorized mean. 9.1, 9.2, 9.3, 9.2, 9.2, 9.9 Arrange the data in ascending order 9.1, 9.2, 9.2, 9.2, 9.3, 9.9 Position of Q1 = (6+1)/4 = 1.75Q1 = 2nd value approximately = 9.2 Position of Q3 = 3(6+1)/4 = 5.25Q3 = 5<sup>th</sup> value approximately = 9.3 Trimmed Mean = (9.2 + 9.2 + 9.2 + 9.3) / 4 = 9.225Winsorized Mean = (9.2 + 9.2 + 9.2 + 9.2 + 9.3 + 9.3) / 6 = 9.233

#### **DISPERSION OF DATA**

**Definition** The degree to which numerical data tend to spread about an average is called the dispersion of data

#### TYPES OF MEASURES OF DISPERSION

Absolute measures Relative measures (coefficients)

#### **DISPERSION OF DATA**

Types Of Absolute Measures:

•Range

- •Quartile Deviation
- Mean Deviation
- Standard Deviation or Variance
- Types Of Relative Measures
- Coefficient of Range
- Coefficient of Quartile Deviation
- Coefficient of Mean Deviation
- Coefficient of Variation

#### LECTURE 27 STATISTICAL REPRESENTATION MEASURES OF DISPERSION AND SKEWNESS PART 2

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 26
- Measures of Dispersion and Skewness

#### MEASURES OF CENTRAL TENDENCY, VARIATION AND SHAPE FOR A SAMPLE

There are many different measures of central tendency as discussed in the last lecture handout. These include:

- Mean, Median, Mode, Midrange, Quartiles, Midhinge
- Range, Interquartile Range
- Variance, Standard Deviation, Coefficient of Variation
- Right-skewed, Left-skewed, Symmetrical Distributions
- Measures of Central Tendency, Variation and ShapeExploratory Data Analysis
- Five-Number Summary
- Box-and-Whisker Plot
- Proper Descriptive Summarisation
- Exploring Ethical Issues
- Coefficient of Correlation

#### <u>MEANS</u>

The most common measure of central tendency is the mean. The slide below shows the Mean (Arithmetic), Median, Mode and Geometric mean. Another mean not shown is the Harmonic mean. Each of these has its own significance and application. The mean is the arithmetic mean and represents the overall average. The median divides data in two equal parts. Mode is the most common value. Geometric mean is used in compounding such as investments that are accumulated over a period of time. Harmonic mean is the mean of inverse values. Each has its own utility. The slide shows the formulas for mean and geometric mean.

#### THE MEAN

The formula for Arithmetic Mean is given in the slide. It is the sum of all values divided by the number. In the case of mean of a sample, the number n is the total sample size.

When the sample data is to be used for estimating the value of mean, then the number is reduced by 1 to improve the estimate. In reality this will be a slight overestimation of the population mean. This is done to avoid errors in estimation based on sample data that may not be truly represented of the population.

#### The Mean (Arithmetic Average)

#### The Arithmetic Average of data values:

#### EXTREME VALUES

An important point to remember is that arithmetic mean is affected by extreme values. In the following slide mean of 5 values 1, 3, 5, 7 and 9 is 5. In the second case where the data values are 1, 3, 6, 7 and 14, the value 14 is an outlier as it is considerably different from the other values. In this case the mean is 6. in other words the mean increased by 1 or about 20% due to the outlier. While preparing data for mean, it is important to spot and eliminate outlier values.

### The Mean

The Most Common Measure of Central Tendency

Affected by Extreme Values (Outliers)

#### THE MEDIAN

The Median is derived after ordering the array in ascending order. If the number of

### The Median

#### Important Measure of Central Tendency In an ordered array, the median is the "middle" number. If n is odd, the median is the middle number If n is even, the median is the average of the 2 middle numbers

observations is odd, it is the middle value otherwise it is the the average of the two middle values. It is not affected by extreme values.

### The Median

Not Affected by Extreme Values

#### THE MODE

The mode is the value that occurs most frequently. In the example shown on the slide, 8 is the most frequently occurring value. Hence the mode is 8. Mode is also not affected by extreme values.

# The Mode

A Measure of Central Tendency Value that Occurs Most Often

Not Affected by Extreme Values

An important point about Mode is that there may not be a Mode at all (no value is occurring frequently). There may be more than one mode. The mode can be used for numerical or categorical data. The slide shows two examples where there is no mode or there are two modes.

# The Mode

There May Not be a Mode There May be Several Modes

Used for Either Numerical or Categorical Data

0000000 0123450 No Mode

#### RANGE

Another measure of dispersion of data is the Range. It is the difference between the largest and smallest value. The slides show examples where the value of range was calculated

### DISPERSION OF DATA

**Range** R = Largest – Smallest Value Example Find range: 31, 26, 15, 43, 19, 27, 22, 12, 36, 33, 30, 24, 20 Largest value = 43 Smallest = 12 Range = 43 – 12 = 31

# The Range

#### Measure of Variation Difference Between Largest & Smallest Obser⊽ations.

Range = Largest – Smallest Value

Ignores How Data Are Distributed:

Range = 12 - 7 = 5			F	lan	ge =	- 12	- 7 -	= 5			
۰	•	•	•	•	•			_	•	•	8
7	8	9	10	n	12	7	8	9	10	п	12

#### MIDRANGE

Midrange is the average of smallest and largest value. In other words it is half of a range. Midrange is affected by extreme values as it is based on smallest and largest values

# Midrange

A Measure of Central Tendency

Average of Smallest and Largest

Observation:

Midrange = 
$$\frac{X_{largest} + X_{suallest}}{2}$$

# Midrange

#### Affected by Extreme Value

#### **QUARTILES**

Quartiles are not exclusively measures of central tendency. However, they are useful for dividing the data in 4 equal parts, each containing 25% of the data. So there are three quartiles. 25% data falls below first quartile, 50% below second and 75% below third quartile.

### Quartiles

#### Not a measure of central tendency Split ordered data into 4 quarters

25%	25%	25%	25%
(	α <sub>1</sub> α	Q₂ C	<b>)</b> 3

Position of ith quartile =  $\frac{i(n + 1)}{4}$ 

Where i = 1, 2, 3 and n is the number of data points.

To understand the procedure of finding the value of each quartile let us consider an example.

#### Example:

Find first, second and third quartile of the following data 11, 22, 17, 16, 12, 21, 16, 13, 18

Arrange the data in ascending order. 11, 12, 13, 16, 16, 17, 18, 21, 22

Here n = number of data points = 9

Position of first quartile Q1 =  $\frac{9+1}{4}$  = 2.5

Since we get position of first quartile as decimal fraction, so we proceed as follows  $Q1 = 2^{nd}$  value + 0.5 × ( $3^{rd}$  value -  $2^{nd}$  value)

Position of second quartile Q2 =  $\frac{2 \times (9 + 1)}{4}$  = 5

So,  $Q2 = 5^{th}$  value = 16

Position of third quartile Q3 =  $3 \times (9 + 1) = 7.5$ 

#### **MIDHINGE:**

Midhinge is the average of the first and third quartiles. Midhinge =  $\frac{Q1 + Q3}{2}$ 

#### QUARTILE DEVIATION

Quartile Deviation is the average of  $1^{st}$  and  $3^{rd}$  Quartile. Q.D = (Q3 - Q1)2

#### **Example**

Find Q.D of the following data 14, 10, 17, 5, 9, 20, 8, 24, 22, 13

Here number of data points = n = 10Position of Q1 = (n+1)/4 = (10+1)/4 = 2.75

So Q1 =  $2^{nd}$  value + 0.75 × ( $3^{rd}$  value -  $2^{nd}$  value) = 8 + 0.75 × (9 - 8) = 8 + 0.75 × 1 = 8.75

Position of Q3 =  $3 \times (10 + 1)/4 = 3 \times (2.75) = 8.25$ So Q3 = 8th value + 0.25(9th value - 8th value) =  $20 + 0.25 \times (22 - 20)$ = 20.50

$$Q.D = \frac{(20.50 - 8.75)}{2} = 5.875$$

#### SHAPE OF DISTRIBUTION

- 1. Symmetrical Distribution
- 2. Asymmetrical Distribution
  - a. Right-skewed or positively-skewed distribution
  - b. Left-skewed or negatively-skewed distribution

We can find the shape of distribution using 5-number summary.

#### 5-NUMBER SUMMARY:

5 number summary is:

- Smallest value
- 1<sup>st</sup> Quartile (Q1)
- Median(Q2)
- 3<sup>rd</sup> Quartile (Q3)
- Largest value

#### **BOX AND WHISKER PLOT:**

Box and whisker plot shows 5-number summary.

### Exploratory Data Analysis

# Box-and-whisker: Graphical display of data using 5-number summary $X_{smallest} \quad Q_1 \qquad \qquad Q_3 \qquad X_{largest}$ $4 \qquad 6 \qquad 8 \qquad 10 \qquad 12$

The plot gives a good idea about the shape of the distribution as detailed below. Box and whisker plot for symmetrical, left-skewed and right-skewed distribution are shown below.

Distribution Shape & Box-and-whisker Plots

#### 1. Symmetrical Distribution:

Data is perfectly symmetrical if:

- Distance from Q1 to Median = Distance from Median to Q3
- Distance from X<sub>smallest</sub> to Q1 = Distance from Q3 to X<sub>largest</sub>

That is,

Median = Midhinge = Midrange

#### 2. Asymmetrical Distribution:

#### a) Right-skewed distribution

Distance from X<sub>largest</sub> to Q3 greatly exceeds distance from Q1 to X<sub>smallest</sub>

That is, Median < Midhinge < Midrange

#### b) Left-skewed distribution

Distance from Q1 to X<sub>smallest</sub> greatly exceeds distance from X<sub>largest</sub> to Q3

That is,

Median > Midhinge > Midrange

#### **Example**

Suppose there are nine homes valued at Rs. 150,0000, Rs. 140,0000, Rs.160,0000, Rs.150,0000, Rs.150,0000, Rs.160,0000, Rs.170,0000, Rs.160,0000, Rs.150,0000, and Rs160,0000 in a new area. There is one small empty lot in the area and someone builds small home with a valuation of Rs. 20,0000. Find either the frequency polygon of these values is negatively skewed or positively skewed. Following sample represents annual costs (in '000 Rs) for attending 10 conferences. 13.0, 14.5, 14.9, 15.2, 15.2, 15.4, 15.6, 16.2, 17, 23.1 Find 5-number summary and shape of the distribution.

Position of Q1 = (10 + 1) / 4 = 2.75 Q1 = 14.5 + 0.75 × (14.9 - 14.5) = 14.8

Position of Q3 = 3 \* (10 + 1) / 4 = 8.25 Q3 = 16.2 + 0.25 × (17 - 6.2) = 16.4

Median = (15.2 + 15.4) / 2 = 15.3

Thus 5-number summary is

- Smallest value = 13.0
- 1<sup>st</sup> Quartile (Q1) = 14.8
- Median(Q2) = 15.3
- 3<sup>rd</sup> Quartile (Q3) = 16.4
- Largest value = 23.1

Midrange = Largest value + Smallest value =  $\frac{23.1 + 13.0}{2}$  = 18.05

Midhinge =  $\frac{Q1 + Q3}{2} = \frac{14.8 + 16.4}{2} = 15.6$ 

Find the relationship between median, midhinge and midrange Median < Midhinge < Midrange Thus the shape of distribution is right skewed.

#### SUMMARY MEASURES

The slide shows summary of measures of central tendency and variation. In variation there are range, Interquartile range, standard deviation, variance, and coefficient of variation. The measures of central tendency have been discussed already

#### MEASURES OF VARIATION

In measures of variation, there are the sample and population standards deviation and variance the most important measures. The coefficient of variation is the ratio of standard deviation to the mean in %.

### **Measures of Variation**

#### **INTERQUARTILE RANGE**

Interquartile range is the difference between the 1<sup>st</sup> and 3<sup>rd</sup> quartile.

# Interquartile Range

Measure of Variation

Also Known as Midspread: Spread in the Middle 50%

Difference Between Third & First Quartiles: Interquartile Range =

Data in Ordered Array: 11 12 13 16 16 17 17 18 21  $\hat{\mathcal{Q}}_{3} = \hat{\mathcal{Q}}_{1} = 17.5 - 12.5 = 5$ Not Affected by Extreme Values

#### LECTURE 28 MEASURES OF DISPERSION CORRELATION PART 1

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 27
- Measures of Dispersion
- Correlation

#### MODULE 6

Module 6 covers the following: Correlation (Lecture 28-29) Line Fitting (Lectures 30-31) Time Series and Exponential Smoothing (Lectures 32-33)

#### VARIANCE

Variance is the one of the most important measures of dispersion. Variance gives the average square of deviations from the mean. In the case of the population, the

# Variance

Sum of square of deviations is divided by N the number of values in the population. In the case of variance for the sample the number of observations less 1 is used. STANDARD DEVIATION

Standard deviation is the most important and widely used measure of dispersion. The square root of square of deviations divided by the number of values for the population and number of observations less 1 gives the standard deviation.

# **Standard Deviation**

Most Important Measure of Variation

Shows Variation About the Mean

Same unit of measurement as the observations  $\sigma = \sqrt{\frac{\sum (X - \mu)^2}{N}}$ 

For the Population:

For the Sample: $s = \sqrt{\frac{\sum (X_{i} - \overline{X})}{n-1}}$						
For the Population: use N	For the Sample : use n					
in the denominator.	- 1 in the denominator					

#### **Example**

Let us do this for a simple data-set shown below: The Number of Fatalities in Motorway Accidents in one Week:

Day	Number of fatalities X
Sunday	4
Monday	6
Tuesday	2
Wednesday	0
Thursday	3
Friday	5
Saturday	8
Total	28

The arithmetic mean number of fatalities per day is

$$\overline{\mathbf{X}} = \frac{\sum \mathbf{X}}{n} = \frac{28}{7} = 4$$

Taking the deviations of the X-values from their mean, and then squaring these deviations, we obtain:

Χ	$(x-\overline{x})$	$(x-\overline{x})^2$
4	0	0
6	+ 2	4
2	- 2	4
0	- 4	16
3	- 1	1
5	+ 1	1
8	+ 4	16
		42

Hence  $\sum (x - \overline{x})^2 = 42$  is now positive, and this positive value has been achieved without 'bending' the rules of mathematics. Averaging these squared deviations, the variance is given by:

#### Variance:

$$= \frac{\sum (x-\overline{x})^2}{n-1}$$
$$= \frac{\frac{42}{6}}{6} = 7$$

The variance is frequently employed in statistical work, but it should be noted that the figure achieved is in 'squared' units of measurement.

In the example that we have just considered, the variance has come out to be "6 squared fatalities", which does not seem to make much sense!

In order to obtain an answer which is in the original unit of measurement, we take the positive square root of the variance. The result is known as the standard deviation.

#### **Standard Deviation**

S.D = 
$$\sqrt{\frac{\sum (x - \overline{x})^2}{n - 1}}$$
  
=  $\sqrt{\frac{42}{6}}$  = 2.65 fatalities

The formulae that we have just discussed are valid in case of raw data. In case of grouped data i.e. a frequency distribution, each squared deviation round the mean must be multiplied by the appropriate frequency figure i.e.

#### **COMPARING STANDARD DEVIATIONS**

In many situations it becomes necessary to calculate population standard deviation (SD) on the basis of SD of the sample where n-1 is used for

data considered as a Sample.

division. In the slide the same data is first treated as the sample and the value of SD is 4.2426. When we treat it as the population the SD is 3.9686, which is slightly less than the SD for the sample. You can see how the sample SD will be overestimated if used for the population.

#### **COMPARING STANDARD DEVIATIONS**

The slide shows three sets of data A, B and C. All the three datasets have the same mean 15.5 but different standard deviations (A: s=3.338; B: s=0.9258 and C: s=4.57). It is clear that SD is an important measure to understand how different sets of data differ from each other. Mean and SD together form a complete description of the central tendency of data.

#### Comparing Standard Deviations Data A 8 0 0 16 17 18 19 20 Mean = 15.5 ۲ O 12 13 s = 3.338 Data B Mean = 15.5 fT. 12 s = .9258 Data C Mean = 15.5 s = 4.57

#### **COEFFICIENT OF VARIATION**

203

### Comparing Coefficient of Variation

Coefficient of variation (CV) shows the dispersion of the standard deviation about the mean. In the slide you see two stocks A and B with CV=10% and 5% respectively. This comparison shows that in the case of stock A there was a much greater variation in price with reference to the mean.

#### EXAMPLE-

Suppose that, in a particular year, the mean weekly earnings of skilled factory workers in one particular country were \$ 19.50 with a standard deviation of \$ 4, while for its neighboring country the figures were Rs. 75 and Rs. 28 respectively.

Stock B: CV = 5%

From these figures, it is not immediately apparent which country has the GREATER VARIABILITY in earnings.

The coefficient of variation quickly provides the answer:

COEFFICIENT OF VARIATION

For country No. 1:

$$\frac{4}{19.5} \times 100 = 20.5$$
 per cent,

And for country No. 2:

$$\frac{28}{75} \times 100 = 37.3$$
 per cent.

From these calculations, it is immediately obvious that the spread of earnings in country No. 2 is greater than that in country No. 1, and the reasons for this could then be sought.

#### MEAN DEVIATION

Other useful measures are Mean Deviation about the Mean and median.

The mean deviation of a set of data is defined as the arithmetic mean of the deviations measured either from the mean or from the median. The symbolic definition of the **mean deviation about the mean** is

$$M.D = \frac{1}{n} \sum_{i=1}^{n} |x - \overline{x}|$$
, for sample

VU

$$M.D = \frac{1}{N} \sum_{i=1}^{N} |x - \mu|$$
, For a population

<u>Note</u> that first take the absolute value of difference of data point and the mean and then add those **absolute values**. The absolute value of a number is the number without its sign.

#### Example:

Calculate the mean deviation from mean and median, of the following set of examination marks

45, 32, 37, 46, 39, 36, 41, 48, and 36.

#### Solution:

Median = 39

$$Mean = \frac{\sum x}{n}$$

Mean = 360/9 = 40 marks

	X <sub>i</sub>	$x_i - \overline{x}$	$\left  x_{i} - \overline{x} \right $	$ x_i - Median $
	32	-8	8	7
	36	-4	4	3
	36	-4	4	3
	37	-3	3	2
	39	-1	1	0
	41	1	1	2
	45	5	5	6
	46	6	6	7
	48	8	8	9
Sum	360	0	40	39

Mean Deviation from Mean =  $\frac{\sum |x_i - \overline{x}|}{n} = 40/9 = 4.4$  marks

Mean Deviation from Median =  $\frac{\sum |x_i - Median|}{n}$  = 39/9 = 4.3 marks

In excel ABS function returns the absolute value of a number.

#### Syntax

#### ABS(number)

**Number** is the real number of which you want the absolute value.

For the data organized into a grouped frequency distribution having **k** classes with midpoints  $x_1$ ,  $x_2$ ,  $x_3$ , ...., $x_k$  and the corresponding frequencies  $f_1$ ,  $f_2$ ,  $f_3$ , ....,  $f_i$  ( $\Sigma$   $f_i$  = N), the mean deviation about mean for grouped data is given by

$$M.D = \frac{\sum_{i=1}^{n} f_i |x_i - \overline{x}|}{\sum f_i}$$

Similarly we can define mean deviation about median, just by replacing the mean value in formula with the median.

#### **REGRESSION ANALYSIS**

The primary objective of regression analysis is the development of a regression model to explain the association between two or more variables in the given population. A regression model is the mathematical equation that provides prediction of value of dependent variable based on the known values of one or more independent variables.

In regression Analysis, we shall encounter different types of regression models. One of the main functions of regression analysis is determining the simple linear regression equation. What are the different Measures of variation in regression and correlation? What are the Assumptions of regression and correlation? What is Residual analysis? How do we make

Inferences about the slope? How can you estimate predicted values? What are the Pitfalls in regression? What are the ethical issues?

An important point in regression analysis is the purpose of the analysis.

#### SCATTER DIAGRAM

The first step in regression analysis is to plot the values of the dependent and independent variable in the form of a scatter diagram as shown below. The form of the scatter of the points indicates whether there is any degree of association between them. In the scatter diagram below you can see that there seems to be a fairly distinct correlation between the two variables. It appears as if the points were located around a straight line.

#### **Types of Regression Models**

There are two types of linear models as shown in the slide below. These are positive and negative linear relationships. In the positive relationship, the value of the dependent variable increases as the value of the independent variable increases. In the case of negative linear relationship, the value of the dependent variable decreases with increase in the value of independent variable.

### Types of Regression Models

Positive Linear Relationship

Negative Linear Relationship

VU

#### LECTURE 29 MEASURES OF DISPERSION CORRELATION PART 2

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 28
- Correlation

#### CORRELATION

Correlation is a measure of the strength or the degree of relationship between two RANDOM variables.

#### When do we use correlation?

It will be used when we wish to establish whether there is a degree of association between two variables. If this association is established, then it makes sense to proceed further with regression analysis. Regression analysis determines the constants of the regression. You can not make any predictions with results of correlation analysis. Predictions are based on regression equations.

#### **CORRELATION ANALYSIS**

To analyze the strength of the relationship or co-variation between two variables, we use correlation analysis.

Correlation analysis contributes to the understanding of economics behavior, aids in locating the critically important variables on which others depends, may reveal to the economist the connections by which disturbances spread and suggest to him the path through which stabilizing forces may become effective

# CORRELATION

When do we use correlation? Do use it to determine the strength of association between two variables Do not use it if you want to predict the value of X given Y, or vice versa

#### SIMPLE LINEAR CORRELATION VERSUS SIMPLE LINEAR REGRESSION

The calculations for linear correlation analysis and regression analysis are the same. In correlation analysis, one must sample randomly both X and Y. Correlation deals with the association (importance) between variables whereas

Regression deals with prediction (intensity).

The slide shows three types of correlation for both positive and negative linear relationships. In the first figure (r = ...0.9), the data points are practically in a straight

VU

line. This kind of association or correlation is near perfect. This applies to negative correlation also.

The graphs where r = 0.5, the points are more scattered, there is a clear association but this association is not very pronounced.

In graphs where r = 0, there is no association between variables.

#### CORRELATION COEFFICIENT

For calculation of correlation coefficient:

- 1. A standardised transform of the covariance (sxy) is calculated by dividing it by the product of the standard deviations of X (sx) & Y (sy).
- 2. It is called the population correlation coefficient is defined as:

$$r = s_{XY}/s_Xs_Y$$

or

$$r = \frac{Cov(X,Y)}{\sqrt{Var(X)Var(Y)}}$$

Where, covariance of X and Y is defined as

$$Cov(X,Y) = \frac{\sum (X - \overline{X})(Y - \overline{Y})}{n}$$

This formula is a bit cumbersome to apply. Therefore, we may use the following short cut formula:

#### Short Cut Formula

$$r = \frac{\sum XY - (\sum X)(\sum Y)/n}{\sqrt{\left[\sum X^{2} - (\sum X)^{2}/n\right]\left[\sum Y^{2} - (\sum Y)^{2}/n\right]}}$$

It should be noted that

r is a pure number that lies between -1 and 1 i.e.

**-**1 < **r** < 1

Actually, the mathematical expression that you have just seen is a combination of three different mathematical expressions:

**Case 1:** Positive correlation: 0 < r < 1

In case of a positive linear relationship, r lies between 0 and 1.

In this case, the closer the points are to the UPWARD-going line, the STRONGER is the positive linear relationship, and the closer r is to 1.

### Case 2:

No correlation: r = 0

VU

The extreme of dissociation (zero correlation (r = 0)):

In such a situation, X and Y are said to be *uncorrelated*.

# Case 3: Negative correlation: -1 < r < 0

#### <u>Warning</u>

- Existence of a high correlation does not mean there is causation, which means that there may be a correlation but it does not make things happen because of that.
- There can exist spurious correlations. And correlations can arise because of the action of a third unmeasured or unknown variable. In many situations correlation can be high without any solid foundation.

#### EXAMPLE

Suppose that the principal of a college wants to know if there exists any correlation between grades in Mathematics and grades in Statistics. Suppose that he selects a random sample of 9 students out of all those who take this combination of subjects. The following information is obtained:

Student	Marks in Mathematics (Total Marks: 25)	Marks in Statistics (Total Marks: 25)
	Χ	Y
Α	5	11
В	12	16
С	14	15
D	16	20
E	18	17
F	21	19
G	22	25
Н	23	24
Ι	25	21

#### SCATTER DIAGRAM

In order to compute the correlation coefficient, we carry out the following computations:

Х	Y	$X^2$	$Y^2$	XY
5	11	25	121	55
12	16	144	256	192
14	15	196	225	210
16	20	256	400	320
18	17	324	289	306
21	19	441	361	399
22	25	484	625	550
23	24	529	576	552
25	21	625	441	525
156	168	3024	3294	3109

$$= \frac{\sum XY - (\sum X)(\sum Y)/n}{\sqrt{\left[\sum X^2 - (\sum X)^2/n\right]\left[\sum Y^2 - (\sum Y)^2/n\right]}}$$
$$= \frac{3109 - (156)(168)/9}{\sqrt{\left[3024 - (156)^2/9\right]\left[3294 - (168)^2/9\right]}}$$

$$= \frac{5109 - 2912}{\sqrt{[3024 - 2704][3294 - 3136]}}$$
$$= \frac{197}{\sqrt{320 \times 158}} = \frac{197}{224.86} = 0.88$$

There exists a strong *positive* linear correlation between marks in Mathematics and marks in Statistics for these 9 students who have been taken into consideration.

#### EXCEL Tools

r

- For summary of sample statistics, use: Tools / Data Analysis / Descriptive Statistics
- For individual sample statistics, use: Insert / Function / Statistical and select the function you need

#### **EXCEL Functions**

- In EXCEL, use the CORREL function to calculate correlations
- The correlation coefficient is also given on the output from TOOLS, DATA ANALYSIS, CORRELATION or REGRESSION

#### Scatter Diagram Two Variables

You can develop a scatter diagram using EXCEL chart wizard.

The slide shows a scatter diagram of Advertisement and Sales over the years. The graph was made using EXCEL chart Wizard. As you can see one cannot draw any conclusions about the degree of association between advertising from this graph.

#### SALES VERSUS ADVERTISEMENT

The scatter diagram for sale versus advertisement shows a fairly high degree of association. The relationship appears to be positive and linear.

#### **CORRELATION COEFFICIENT USING EXCEL**

Correlation Coefficient for correlation between two steams of data was calculated using the formula Cov(x,y)/Sx.Sy as given above.

The data for variable x was entered in cells A67 to A71. Data for variable y was entered in cells B67 to B71.Calculations for square of x, square of y, product of x and y, Xm, Ym and cov(x,y) were made in columns C, D, E, F and G respectively. Other calculations were made as follows:

Cell A72: Sum of x (=SUM(A67:A71)

Cell B72: Sum of y (=SUM(B67:B71)

Cell C72: Sum of square of x (=SUM(C67:C71)

Cell D72: Sum of square of y (=SUM(D67:D71)

Cell E72: Sum of product of x and y (=SUM(E67:E71)

Cell F72: Mean of x (=A72/5), where 5 is the number of observations

Cell G72: Mean of y (=B72/5), where 5 is the number of observations

Cell F73: Sx (=SQRT(C72/5-F72\*F72))

Cell G73: Sy =(SQRT(D72/5-G72\*G72))

Cell H73: Cov(x,y) (=E72/5-F72\*G72)

Cell H74: Correlation coefficient (=H73/(F73\*G73))

The above formulas are in line with formulas described earlier.

#### CORREL

Returns the correlation coefficient of the array1 and array2 cell ranges. Use the correlation coefficient to determine the relationship between two properties. For example, you can examine the relationship between a location's average temperature and the use of air conditioners.

#### Syntax

#### CORREL(array1,array2)

Array1 is a cell range of values.

Array2 is a second cell range of values.

#### <u>Remarks</u>

- The arguments must be numbers, or they must be names, arrays, or references that contain numbers.
- If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value zero are included.
- If array1 and array2 have a different number of data points, CORREL returns the #N/A error value.

If either array1 or array2 is empty, or if s (the standard deviation) of their values equals zero, CORREL returns the #DIV/0! error value.

#### **EXCEL Calculation**

The X and Y arrays are in cells A79 to A83 and B79 to B83 respectively. The formula for correlation coefficient was entered in cell D84 as =CORRE(A79:A83;B79:B83). The value or r (0.8) is shown in cell C86.

#### LECTURE 30 Measures of Dispersion LINE FITTING PART 1

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 29
- Line Fitting

#### EXCEL SUMMARY OF SAMPLE STATISTICS

For summary of sample statistics, use: **Tools > Data Analysis > Descriptive Statistics** For individual sample statistics, use: **Insert > Function > Statistical** and select the function you need

#### EXCEL STATISTICAL ANALYSIS TOOL

You can use **EXCEL** to perform a statistical analysis:

- On the **Tools** menu, click Data **Analysis**. If **Data Analysis** is not available, load the **Analysis** ToolPak.
- In the **Data Analysis** dialog box, click the **name of the analysis tool** you want to use, and then click OK.
- In the dialog box for the tool you selected, set the analysis options you want.
- You can use the Help button on the dialog box to get more information about the options.

#### LOAD THE ANALYSIS TOOLPAK

You can load the EXCEL Analysis ToolPak as follows:

On the Tools menu, click Add-Ins.

In the **Add-Ins** available **list**, select the **Analysis ToolPak** box, and then click **OK**. If necessary, follow the instructions in the setup program

#### <u>SLOPE</u>

Returns the slope of the linear regression line through data points in known\_y's and known\_x's. The slope is the vertical distance divided by the horisontal distance between any two points on the line, which is the rate of change along the regression line.

#### Syntax

#### SLOPE(known\_y's,known\_x's)

Known\_y's is an array or cell range of numeric dependent data points.

Known\_x's is the set of independent data points.

#### <u>Remarks</u>

The arguments must be numbers or names, arrays, or references that contain numbers. If an array or reference argument contains text, logical values, or empty cells, those

values are ignored; however, cells with the value zero are included.

If known\_y's and known\_x's are empty or have a different number of data points, SLOPE returns the #N/A error value.

The equation for the slope of the regression line is:

$$b = \frac{n\sum xy - (\sum x)(\sum y)}{n\sum x^2 - (\sum x)^2}$$

#### Example

The known y-values and x-values were entered in cells A4 to A10 and B4 to B10 respectively. The formula =SLOPE(A4:A10;B4:B10) was entered in cell A11. The result 0.305556 is the value of slope in cell B12.

		0.305556					
	B4:B10)						

#### **INTERCEPT**

Calculates the point at which a line will intersect the y-axis by using existing x-values and y-values. The intercept point is based on a best-fit regression line plotted through the known x-values and known y-values. Use the INTERCEPT function when you want to determine the value of the dependent variable when the independent variable is 0 (zero). For example, you can use the INTERCEPT function to predict a metal's electrical resistance at 0°C when your data points were taken at room temperature and higher.

### Syntax

#### INTERCEPT(known\_y's,known\_x's)

Known\_y's is the dependent set of observations or data.

Known\_x's is the independent set of observations or data.

#### Remarks

The arguments should be either numbers or names, arrays, or references that contain numbers.

If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value zero are included.

If known\_y's and known\_x's contain a different number of data points or contain no data points, INTERCEPT returns the #N/A error value.

The equation for the intercept of the regression line is:

$$a = \overline{Y} - b\overline{X}$$
  
where the slope is calculated as:  
$$b = \frac{n\Sigma_{XY} - (\Sigma_X)(\Sigma_Y)}{n\Sigma_X^2 - (\Sigma_X)^2}$$

#### **Example**

The data for y-values was entered in cells A18 to A22. The data for x-values was entered in cells B18 to B22. The formula =INTERCEPT(A18:A22;B18:B22) was entered in cell A24. The answer 0.048387 is shown in cell B25.

#### LECTURE 31 LINE FITTING PART 2

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 30
- Line Fitting

#### Types of Regression Models

There are different types of regression models. The simplest is the Simple Linear Regression Model or a relationship between variables that can be represented by a straight line equation.

To determine whether a linear relationship exists, a Scatter Diagram is developed first.

# The Scatter Diagram

Plot of all (X<sub>i</sub>, Y<sub>i</sub>) pairs

In linear regression two types of models are considered. The first one is the Population Linear Regression that represents the linear relationship between the variables of the entire population (i.e. all the data). It is quite customary to carry out sample surveys and determine linear relationship between two variables on the basis of sample data. Such regression analysis is called Sample Linear Regression.

10

5

0

0

15

If the relationship between the variables is exactly linear, then the mathematical equation describing the liner relation is written as

Y = a + bX.

Where

Y represents the dependent variable

X represents the independent variable

a represents the Y-intercept

1 0.5 0

0

(i.e. the value of Y when X is equal to zero)

b represents the slope of the line

(i.e. the value of the tan  $\theta$ , where  $\theta$  represents the angle between the line and the horizontal axis)

#### **Interpretation of 'a' and 'b':**

A very important point to note is that MANY lines can be drawn through the same scatter diagram.

In contrast to the above, the liner relationship in some situations is not exact. For this we add an unknown random error variable as

 $Y_i = a + bX_i + e_i$ 

We assume that the liner relationship between the dependent variable  $Y_i$  and the value  $X_i$  of the regressor X is.

# Population Linear Regression

 Population Regression Line Is A Straight Line that Describes The Dependence of The Average Value of One Variable on The Other

The slide below shows the graphical representation of the population regression equation. It may be seen that the distance of the points from the regression line

VU

(obtained by inserting values of X in the equation) is the random error. The intercept is shown on the Y-axis.

# Population Linear Regression (continued) $Y_{i} = \beta_{0} + \beta_{1}X_{i} + \varepsilon_{i}$ Dbserved Value $\mathcal{E}_{i} = \mathbf{R}$ and on Errog $\mathcal{H}_{2X} = \beta_{0} + \beta_{1}X_{i}$ Observed Value

The slide below shows the regression equation for the sample. Note that the intercept in this case has a notation  $B_0$ . The slope is  $B_1$ . The random error is e1. Different notations are used to distinguish between population regression and sample regression.

### Sample Linear Regression

#### REGRESSION EQUATION EXAMPLE

Computer the least square regression equation of Y on X for the following data.

Х	5	6	8	10	12	13	15	16	17	
Y	16	19	23	28	36	41	44	45	50	

#### Solution:

The estimated regression line of Y on X is

Y = a + bX

In the previous lecture we learn that the equation for the slope of the regression line is:

$$b = \frac{n\sum xy - (\sum x)(\sum y)}{n\sum x^2 - (\sum x)^2}$$

And the equation for the intercept of the regression line is: а

$$x = \overline{Y} - b\overline{X}$$

Now from the given data  $\overline{X} = \frac{\sum X}{n} = 102/9 = 11.33$ 

$$\overline{Y} = \frac{\sum Y}{n} = 302/9 = 33.56$$

$$b = \frac{n\sum XY - (\sum X)(\sum Y)}{n\sum X^2 - (\sum X)^2} = 2.831$$

$$a = \overline{Y} - b\overline{X} = 33.56 \cdot (2.831)(11.83) = 1.47$$

Hence the desired estimated regression line is

Y = 1.47 + 2.831X

#### **REGRESSION EXAMPLE**

Regression Analysis can be carried out easily using EXCEL Regression Tool. Let us see how it can be done. We chose to carry out regression on data given in the slide below. Y-values are 60, 100, 70, 90 and 80. X-values are 2, 5, 4, 6

Residuals     Residual Plots       Standardized Residuals     Line Fit Plots   Normal Probability       Normal Probability Plots	

For the sample data the input Y range was selected by clicking in the text box for input y range data first and then selecting the Y range (A85:A89). The regression tool adds the \$ sign in front of the column and row number to fix its location. The input range for X was specified in a similar fashion. No labels were chosen. The default value of 95% confidence interval was accepted. The output range was also selected in an arbitrary fashion. All you need to do is to select a range of cells for the output tables and the graphs. The range A91:F124 was selected as output range by selecting cell A91 and then dragging the mouse in such a manner that the last cell selected on the right was F124.

#### EXCEL REGRESSION TOOL OUTPUT

In the regression Tool output there are a number of outputs for detailed analysis including Analysis of Variance (ANOVA) that is not part of this course. The main points of our interest for simple linear regression are:

#### Multiple R

Correlation Coefficient

#### **R** Square

Coefficient of determination

#### STEM-Standard Error of mean:

Standard deviation of population/sample size

#### **T-Statistic**

= (sample slope - population slope) / Standard error

#### <u>RSQ</u>

There is a separate function RSQ in EXCEL to calculate the coefficient of determination square of r. Description of this function is as follows:

Returns the square of the Pearson product moment correlation coefficient through data points in known\_y's and known\_x's. For more information, see PEARSON. The r-

squared value can be interpreted as the proportion of the variance in y attributable to the variance in x.

#### Syntax

#### RSQ(known\_y's,known\_x's)

Known\_y's is an array or range of data points.

Known\_x's is an array or range of data points.

#### **Remarks**

The arguments must be either numbers or names, arrays, or references that contain numbers.

If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value zero are included.

If known\_y's and known\_x's are empty or have a different number of data points, RSQ returns the #N/A error value.

The equation for the r value of the regression line is:

$$r = \frac{n(\Sigma XY) - (\Sigma X)(\Sigma Y)}{\sqrt{\left[n\Sigma X^2 - (\Sigma X)^2\right]\left[n\Sigma Y^2 - (\Sigma Y)^2\right]}}$$

Example

	Α	В
1	Known y	Known x
2	2	6
3	3	5
4	9	11
5	1	7
6	8	5
7	7	4
8	5	4
	Formula	Description (Result)

#### Formula

=RSQ(A2:A8,B2:B8)

Square of the Pearson product moment correlation coefficient through data points above (0.05795)

#### P-VALUE

In the EXCEL regression Tool, the P-Value is defined as under: P-value is the Probability of not getting a sample slope as high as the calculated value. Smaller the value more significant the result. In our example P-value=0.000133. It means that slope is very significantly different from zero.

#### **Conclusion**

X and y are strongly associated

#### SAMPLING DISTRIBUTION IN r

It is possible to construct a sampling distribution for r similar to those for sampling distributions for means and percentages.

Tables at the end of books give minimum values of r (ignoring sign) for a given sample size to demonstrate a significant non-zero correlation at various significance levels (0.1, 0.05, 0.02, 0.01 and 0.001) and degrees of freedom (1 to 100). It is to be noted that v = degrees of freedom = n -2 in all these calculations.

#### SAMPLING DISTRIBUTION IN r-EXAMPLE1

Look at a sample size n =5. Null hypothesis: r = 0. Calculated coefficient = 0.8. Test the significance at 5% confidence level.

#### Solution:

Look in the table at row with v=n-2=3 and column headed by 0.05.

# **Pearson Product-Moment Correlation Coefficient**

df= N-2	Level of significance for two-tailed test					
N = number of pairs of data	.10	.05	.02	.01		
1	.988	.997	.9995	.9999		
2	.900	.950	.980	.990		
3	.805	.878	.934	.959		
4	.729	.811	.882	.917		
5	.669	.754	.833	.874		
6	.622	.707	.789	.834		
7	.582	.666	.750	.798		
8	.549	.632	.716	.765		
9	.521	.602	.685	.735		

# **Table of Critical Values**

10	.497	.576	.658	.708
11	.476	.553	.634	.684
12	.458	.532	.612	.661
13	.441	.514	.592	.641
14	.426	.497	.574	.628
15	.412	.482	.558	.606
16	.400	.468	.542	.590
17	.389	.456	.528	.575
18	.378	.444	.516	.561
19	.369	.433	.503	.549
20	.360	.423	.492	.537
21	.352	.413	.482	.526
22	.344	.404	.472	.515
23	.337	.396	.462	.505
24	.330	.388	.453	.495
25	.323	.381	.445	.487
26	.317	.374	.437	.479
27	.311	.367	.430	.471
28	.306	.361	.423	.463
29	.301	.355	.416	.456
30	.296	.349	.409	.449
35	.275	.325	.381	.418
40	.257	.304	.358	.393
45	.243	.288	.338	.372
50	.231	.273	.322	.354
60	.211	.250	.295	.325
70	.195	.232	.274	.302
80	.183	.217	.256	.284

90	.173	.205	.242	.267
100	.164	.195	.230	.254

You will find the Tabulated value = 0.878. Sample value of 0.8 is less than 0.878.

#### <u>Conclusi</u>on

Correlation is not significantly different from zero at 5% level. Variables are not strongly associated.

# **SAMPLING DISTRIBUTION IN r-EXAMPLE 2** Look at a smple size n = 5.

Null hypothesis: r = 0Calculated coefficient = -0.95Test the significance at 5% confidence level.

#### Solution:

Look at row with v = 3 and column headed by 0.05. Tabulated value = 0.878. Sample value of 0.95 (ignoring sign) is greater than 0.8783

<u>Correlation</u> Correlation is significantly different from zero at 5% level. Variables are strongly associated.

VU

#### LECTURE 32 TIME SERIES AND EXPONENTIAL SMOOTHING PART 1

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 31
- Time Series and Exponential Smoothing

#### SIMPLE LINEAR REGRESSION EQUATION. EXAMPLE

The slide below shows the data from 7 stores covering square ft and annual sales. The question is whether there is a relationship between the area and the sale for these stores. It is required to find the regression equation that best fits the data.

# Simple Linear Regression Equation: Example

	Store	Square Feet	Annual Sales Rs. (000)
	1	1,726	3,681
You wish to examine the	2	1,542	3,395
relationship between the	3	2,816	6,653
square footage of produce stores and their annual	4	5,555	9,543
sales. Sample data for 7	5	1,292	3,318
stores were obtained. Find	6	2,208	5,563
the equation of the straight	7	1,313	3,760
line that fits the data best			

First of all a scatter diagram is prepared using EXCEL Chart Wizard as shown below. The points on the scatter diagram clearly show a positive linear relationship between the annual sale and the area of store. It means that it will make sense to proceed further with regression analysis.

The estimated regression line of Y on X is

 $\hat{Y} = a + bX$ 

In the previous lecture we learn that the equation for the slope of the regression line is:

$$b = \frac{n\sum xy - \left(\sum x\right)\left(\sum y\right)}{n\sum x^2 - \left(\sum x\right)^2}$$

And the equation for the intercept of the regression line is:

$$a = \overline{Y} - b\overline{X}$$

Stores	X	Y	XY	$\mathbf{X}^2$
1	1726	3681	6353406	2979076
2	1542	3395	5235090	2377764
3	2816	6653	18734848	7929856
4	5555	9543	53011365	30858025
5	1292	3318	4286856	1669264
6	2208	5563	12283104	4875264
7	1313	3760	4936880	1723969
Σ	$\sum X = 16452$	$\sum Y = 35913$	$\sum XY = 104841549$	$\sum X^2 = 52413218$

Now from the given data  $\overline{X} = \frac{\sum X}{n} = 16452/7 = 2350.29$ 

$$\overline{Y} = \frac{\sum Y}{n} = 35913/7 = 5130.429$$

$$b = \frac{n\sum XY - (\sum X)(\sum Y)}{n\sum X^2 - (\sum X)^2} = 1.4866$$

 $a = \overline{Y} - b\overline{X} = 5130.43 - (1.4866)(2350.29) = 1636.489$ 

Hence the desired estimated regression line is

Y = 1636.489 + 1.4866X

Using the EXCEL Regression Tool, the regression equation was derived as given below.

The graph of the regression line was prepared using the regression Tool. The result shows the data points, regression line and text showing the equation. As you see, it is possible to carry out linear regression very easily using Excel's Regression Tool.

#### Interpreting the Results

The slide below gives the main points, namely, that for every increase of 1 sq. ft. there is a sale of 1.487 units or 1407 Rs. As each unit was equal to 1,000. Now that the equation has been developed, we can estimate sale of stores of other sizes using this equation.

# Interpreting the Results

 $\hat{\mathbf{Y}}_{i} = 1636.415 + 1.487X_{i}$ 

The slope of 1.487 means that each increase of one unit in X, we predict the average of Y to increase by an estimated 1.487 units.

The model estimates that for each increase of 1 square foot in the size of the store, the expected annual sales are predicted to increase by Rs.1487

# Interpreting the Results

 $\hat{\mathbf{Y}}_{i} = 1636.415 + 1.487X_{i}$ 

The slope of 1.487 means that each increase of one unit in X, we predict the average of Y to increase by an estimated 1.487 units.

The model estimates that for each increase of 1 square foot in the size of the store, the expected annual sales are predicted to increase by Rs.1487

#### CHART WIZARD

Let us look at how we can use the Chart Wizard. We wish to study the problem shown in the slide below.

2	Cancel	< Back Next > Fi	nish

The result is shown below as a column graph.

Chart Wizard was used again to draw a Side by Side chart using the same data. The result is shown below.

A line graph of the data was also prepared as shown below. This graph shows the seasonal variations in the values of sales.

#### EXAMINATION OF GRAPH TREND

The graph shows that there is a general upward or downward steady behaviour of figures. There are Seasonal Variations also. These are variations which repeat themselves regularly over short term, less than a year. There is also a random effect that is variations due to unpredictable situations. There are cyclical variations which appear as alternation of upward and downward movement.

#### EXTRACTING THE TREND FROM DATA

Look at the following data: 170, 140, 230, 176, 152, 233, 182, 161, 242 There is no explanation regarding time periods. What to do? **First step** Plot figures on graph Horizontal as period 1 Vertical as period 2 **Conclusion** There is a marked pattern that repeats itself. There is a well established method to extract trend with strong repeating pattern

#### **MOVING AVERAGES**

Look at the data in the slide below. There is sales data for morning, afternoon and evening for day 1, 2 and 3. We can calculate averages for each day as shown. These are simple averages for each day.

R 1	Aicrosoft E	xcel - Lect	ure_32		,				_			_ 7
R	<u>F</u> ile <u>E</u> dit	⊻iew Ins	ert F <u>o</u> rmat	<u>T</u> ools <u>D</u>	ata <u>W</u> indow	Help				Type a ques	tion for help	B
D	6	) 🖨 🐰	<b>₽</b>	s н	Ci + 🝓 S	- 🕄 Å	1 10 2	<b>»</b> 16 •	BU	≣ ≣ €		
	G125	<b>•</b>	fx									
	В	С	D	E	F	G	H		J	K	L	M
122					A	VER/	AGES	5				
123					Data		Movin	ig Ave	rage =	Trend		
124	Day 1		Morni	ng	170							
125			Aftern	ioon	140							
126			Eveni	ng	230							
127			Avera	ge				180	=AVE	RAGE(	F124:F	126)
128	Day 2		Morni	ng	176							
129			Aftern	ioon	152							
130			Eveni	ng	233							
131			Avera	ge				187	=AVE	RAGE(	F128:	-130)
132	Day 3		Morni	ng	182							
133			Aftern	oon	161							
134			Eveni	ng	242							
135			Avera	ge				195	=AVE	RAGE(	F132:	134)
136												

Now let us look at the idea of moving averages.

#### First Average- Day 1

= (170 + 140 + 230)/3 = 540/3 = 180Next Average-Morning = (140 + 230 + 176)/3 = 546/3 = 182Next Average-Afternoon = (230 + 176 + 152)/3 = 186Another method Drop 170; Add 176; = (176-170)/3 = 6/3 = 2Last average + 2 = 180 + 2 = 182Caution

You may make a mistake

You saw how it is possible to start with the first 3 values 170, 140 and 230 for the first day and work out the average (180). Next we dropped 170 and added 152 the morning value from day 2. This gave us an average of 182. Similarly, the next value was calculated. Look at the worksheet below for the complete calculation. These averages are called moving averages. You could have used the alternative method but you may make a mistake in mental arithmetic. So let us only use EXCEL worksheets.

🖾 Microsoft Excel - Lecture_32										X

148			Eveni	ng	242								
149													
150													

The moving averages were plotted as shown below. You can see that the seasonal variation has disappeared. Instead you see a clear trend of increase in sales. This plot shows that moving averages can be used for forecasting purposes.

#### **ANALYSING SEASONAL VARIATIONS**

Let us find out how much each period differs from trend **Calculate Actual – trend for each period** <u>Day 1, Afternoon</u> Actual = 180, Trend = 140 Actual – Trend = 140 – 180 = -40 Here, -40 is the seasonal variation. Similarly, other seasonal variations can be worked out.
## LECTURE 33 TIME SERIES AND EXPONENTIAL SMOOTHING PART 2

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 32
- Time Series and Exponential Smoothing.

#### <u>TREND</u>

As discussed briefly in the handout for lecture 32, the trend is given by the moving average minus the actual data. Look at the slide shown below. The average of the morning, afternoon and evening of the first day is 180. This value is written in cell 1179, which is the middle value for first day. The next moving average is written in cell 1180. This means that the last moving average will be written in cell 1185 as the moving average of the morning, afternoon and evening of 3<sup>rd</sup> day will be written against the middle value in cell F185.

Now that all the moving averages have been worked out we can calculate the trend as difference of moving average and actual value.

187													
188													

The actual trend figures are now written as shown in the slide below with M for morning, A for afternoon and E for evening. The titles Day 1, day 2 and Day 3 were written on the left hand side of the table. Further Total for each column was calculated. The total was divided by the non-zero values in the column. For example, in column M, there are 2 non-zero values. Hence, the total 20 was divided by 2 to obtain the average -10. Similarly, the averages in column A and E were calculated. This data is the seasonal variation and can now be used for estimating trend and random variations.

Seasonal adjustment for afternoon period Trend = 180 to 195 (6 intervals) = 15/6 = 2.5 per period Figure for evening of day 3 = 195 + 2.5 = 197.5Morning of day 4 = 197.5+ 2.5 = 200 Afternoon of day 4 = 200 + 2.5 = 202.5 After adjustment of seasonal variation = -36 = 202.5 - 36 = 166.5 or 166

# SEASONABLE VARIATIONS

Seasonal Variations are regarded as constant amount added to or subtracted from the trends. This is a reasonable assumption as seasonal peaks and troughs are roughly of constant size. In practice Seasonal variations will not be constant. These will themselves vary as trend increases or decreases. Peaks and troughs can become less pronounced Seasonal variations as well as the trend are shown in the graph below. You can see that the trend clearly shows a downward slide in values.

In the following slide, the actual values are for 4 quarters per year. Here there is no middle value per year. The moving averages were therefore summarised against the 3<sup>rd</sup> quarter. As this does not reflect the correct position, the average of the first two moving averages was calculated and written as centred moving average in column H. The first centred moving average is the average of 141 and 138 or 139.5. This is used as the trend and the value Actual-Trend is the difference of Actual – Centred Moving Average. Here also the last row does not have a value as the moving average was shifted one position upwards.

variation. The random variation is the difference between the Actual and Expected value. This gives us a complete table with all the values. The values in this table were plotted using the EXCEL Chart Wizard as shown below. You can see that the different components can now be seen clearly.

## Forecast

Sale steadily declined from 139.0 to 130.5.

Over 4 quarters, the sales declined by = 139.0 - 130.5 = 8.5

Trend in Spring 1995 was 133.5.

We can assume annual decrease as on the basis of decline over the last 4 quarters = 8.5 Trend in 1996 = trend in 1995 less decline = 133.5 - 8.5 = 125

Seasonal variation as already worked out = -8

## Hence:

Final forecast = 125 – 8 = 117

# FORECASTING IN UNPREDICTABLE SITUATIONS

Two methods were studied above. Each one has certain features. If there is steady increase in data and repeated seasonal variations, there are many cases that do not conform to these patterns. There may not be a trend. There may not be a short term pattern. Figures may hover around an average mark. How to forecast under such conditions?

Data for sales over a period of 8 weeks is summarized and plotted in the slide below. You may see that the values hover around an average value without any particular pattern. This problem requires a different solution.

# FORECAST

Let us assume that the forecast for week 2 is the same as the actual data for week 1, that is 4500.

Week no. Actual sales Forecast 1 4500 -2 4000 4500

The Actual sale was 4000. Thus, the Forecast is 500 too high.

Another approach would be to incorporate the proportion of error in the estimate as follows:

## new forecast = old forecast + proportion of error $\alpha$

Or

## new forecast = old forecast + $\alpha$ x (old actual – old forecast)

This method is called Exponential Smoothing. We shall learn more about this method in lecture 34.

#### LECTURE 34 FACTORIALS PERMUTATIONS AND COMBINATIONS

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 33
- Factorials
- Permutations and Combinations

#### Module 7

Module 7 covers the following: Factorials Permutations and Combinations (Lecture 34) Elementary Probability (Lectures 35-36) Chi-Square (Lectures 37) Binomial Distribution (Lectures 38)

# FORECAST

Please refer to the Example discussed in Handout 33. Let  $\alpha = 0.3$ **Then:** Forecast week 3 = week 2 forecast +  $\alpha$  x (week 2 actual sale – week 2 forecast) = 4500 - 0.3 x 500 = 4350

## **Conclusion**

Overestimate is reduced by 30% of the error margin 500.

The slide below shows the calculation for normal error as well as alpha x error. You can see that the error is considerably reduced using this approach.

171	9							
172	Fore	cast =	E164+	1164	Error=D	164-E164	1	
173	Erro	rAlpha	a = 0.3					

The forecast is now calculated by adding alpha x Error to the actual sales. The error is the difference between the actual sales and the forecast. The first value is the same as the sale last week. Use of alpha =0.3 is considered very common. This method is called Exponential Smoothing and alpha is Smoothing Constant.

## Rule for obtaining a forecast:

Let A= Actual and F= Forecast. Then:  $F(t) = F(t-1) + \alpha(A(t-1) - F(t-1))$  $= \alpha A (t-1) + (1-\alpha) F (t-1)$  $F(t-1) = \alpha A(t-2) + (1-\alpha) F(t-2)$ Substituting F3 =  $\alpha$  A (t-1) + (1- $\alpha$ ) [ $\alpha$ A (t-2) + (1- $\alpha$ ) F (t-2)] =  $\alpha$  [A (t-1) + (1- $\alpha$ ) A (t-2)] + (1- $\alpha$ ) ^2F (t-2) Replacing F (t-2) by a (t-3) + (1- $\alpha$ ) F (t-3)  $F(t) = \alpha [A(t-1) + (1-\alpha) A(t-2) + (1-\alpha)^{2}A(t-3)] +$ (1- α)F (t-3)

# WHERE TO APPLY EXPONENTIAL SMOOTHING

What kinds of situations require the application of Exponential Smoothing? What are good values of  $\alpha$ ?

# The accepted Criterion is Mean Square Error (MSE).

You can find MSE for by squaring all and including the present one and dividing by the number of periods included.

Sign of good forecast is when MSE stabilizes.

Generally alpha between 0.1 and 0.3 performs best.

## Example

The slide below shows the calculation of MSE. Detailed formulas can be seen in the Worksheet for Lecture 34.

EXPONENTIAL SMOOTHING TOOL

It is possible to use the Exponential Smoothing Tool included in the EXCEL Tools.

Data Analysis		?×
Analysis Tools		OK
Anova: Two-Factor Without Correlation Covariance Descriptive Statistics Exponential Smoothing F-Test Two-Sample for Varia Fourier Analysis Histogram Moving Average Daadee Muscher Conception	Replication	Cancel
Random Number Generation	<u>.</u>	1
After you click OK, the Exp	onential Smoothing Dial	og Box is shown as below:
Exponential Smoothing		<u>?</u> ×
Input		ОК
Input Range:		Canad
Damping factor:		
🗌 🗖 Labels		Help
Output options		
Output Range:		
New Worksheet Ply:		
New Workbook		
└ Chart Output	🗍 Standard Errors	

Different items in the Dialog Box are described below:

# Input Range

Enter the cell reference for the range of data you want to analyze. The range must contain a single column or row with four or more cells of data.

# Damping factor

Enter the damping factor you want to use as the exponential smoothing constant. The damping factor is a corrective factor that minimizes the instability of data collected across a population. The default damping factor is 0.3.

Note Values of 0.2 to 0.3 are reasonable smoothing constants. These values indicate that the current forecast should be adjusted 20 to 30 percent for error in the prior forecast. Larger constants yield a faster response but can produce erratic projections. Smaller constants can result in long lags for forecast values Labels

Select if the first row and column of your input range contain labels. Clear this check box if your input range has no labels; Microsoft Excel generates appropriate data labels for the output table.

# Output Range

Enter the reference for the upper-left cell of the output table. If you select the Standard Errors check box, Excel generates a two-column output table with

standard error values in the right column. If there are insufficient historical values to project a forecast or calculate a standard error, Excel returns the #N/A error value.

*Note* The output range must be on the same worksheet as the data used in the input range. For this reason, the New Worksheet Ply and New Workbook options are unavailable.

#### Chart Output

Select to generate an embedded chart for the actual and forecast values in the output table.

#### Standard Errors

Select if you want to include a column that contains standard error values in the output table. Clear if you want a single-column output table without standard error values.

#### Example

Use of the Exponential Smoothing Tool is shown in the following slides. First the Exponential Tool was selected.

# FACTORIAL

Let us look at natural numbers.

**Natural Numbers** 

1, 2, 3,... Let us now define a factorial of natural numbers, say factorial of 5.

**Five Factorial** 5! = 5.4.3.2.1 or 1.2.3.4.5

Similarly factorial of 10 is:

### Ten Factorial

= 1.2.3.4.5.6.7.8.9.10 = 10.9.8.7.6.5.4.3.2.1

#### In general

n! = n(n-1)(n-2)..3.2.1 or n! = n(n-1)(n-2)! = n(n-1)!<u>FACTORIAL EXAMPLES</u> 10! = 10.9.8.7.6.5.4.3.2.1=3,628,800 8!/5! = 8.7.6.5! / 5!= 8.7.6 = 336 12!/9! = 12.11.10.9!/9! = 12.11.10 = 1320 10!8!/9!5! = 10.9!.8.7.6.5!/9!5! = 10.8.7.6 = 3360<u>WAYS</u>

If operation A can be performed in m ways and B in n ways, then the two operations can be performed together in m.n ways.

# Example

A coin can be tossed in 2 ways. A die can be thrown in 6 ways. A coin and a die together can be thrown in 2.6 = 12 ways

# PERMUTATIONS

An arrangement of all or some of a set of objects in a definite order is called permutation.

# Example 1

There are 4 objects A, B, C and D Permutations of 2 object A & B: AB, BA Permutations in three objects A, B and C: ABC, ACB, BCA, BAC, CAB, CBA

# Example 2

Number of permutations of 3 objects taken 2 at a time = 3P2= 3!/(3-2)! = 3.2 = 6= AB, BA, AC, CA, BC, CB Number of permutations of n objects taken r at a time = nPr = n!/(n-r)!

# Example 3

Let's say you and a friend love going to movies, and you get a Saturday afternoon free so you can indulge yourselves. You go to a multiplex that is showing 6 movies simultaneously, each starting at 2:00 pm, 4:00 pm, and 6:00 pm, after which you have to get back home. How many different ways can you watch the most different movies?

Answer: You have a choice of 6 movies, so this is your set. You can watch one movie at

**Answer:** You have a choice of 6 movies, so this is your set. You can watch one movie at 2:00, one at 4:00, and one at 6:00, therefore you can watch 3 movies and you're looking for the number of 3-permutations. We have then

P(6, 3) = 6! / (6-3)! = 6! / 3! = 6.5.4.3! / 3! = 6.5.4 = 120

There are 120 different ways for you to watch 3 of the 6 movies that Saturday afternoon.

# Example:

Suppose there are 100 numbers to choose from (00 to 99), you must choose 5 numbers in a specific order, and you can only choose a number once. What are your chances of winning the grand prize?

There are 100 choices, and we're only picking 5 of those, so we have P(100,5) = 100! / (100-5)! = 9,034,502,400 ways to pick 5 numbers in a specific order. Since only one of those is the winning sequence, your chances of winning are 1 in 9,034,502,400.

# Example:

A government keeps some confidential information in a heavily guarded room that is locked with a 5-card mechanism. Eight different officials each carry a card, and to get access, the cards must be inserted in a specific order. The order changes daily, and 3 of the 8 cards will not be used on any given day. A novice spy needs to acquire some documents in this room. He manages to acquire all eight cards and slip past the guards, but doesn't realize until he gets to the door that only five cards are used and they must be inserted in the correct order. A wrong entry brings with it a mass of large mean guys with big guns. What are his chances of getting the right sequence?

# **Solution**

The spy has a set of 8 cards to choose 5 from, therefore n=8 and r=5 and P(8,5)=8!/3!=6720. Only one of those 6720 possibilities is correct, so he has a 1 in 6720 chance, or 1/6720 = 0.00015 = 0.015%.

## **PERMUTATIONS OF n OBJECTS**

Number of n permutations of n different objects taken n at a time is n! nPn = n!/(n-n)! = n!/0! = n!/1 = n! = n(n-1)(n-2)..3.2.1Number of permutations of n objects of which n1 are alike of one kind, n2 are alike of one kind and  $n_k$  are alike.  $N!/n_1!n_2!...n_k1$ Example 3 How many possible permutations can be formed from the word STATISTICS? S=3, A =1, T =3, I =2, C = 1 Formula nPr = n!/n1!n2!..nk!= 10!/3!1!3!2!1! = 10.9.8.7.6.5.4.3!/3!3!2!= 50400

## PERMUT

EXCEL function PERMUT can be used to calculate number of permutations.

Returns the number of permutations for a given number of objects that can be selected from number objects. A permutation is any set or subset of objects or events where internal order is significant. Permutations are different from combinations, for which the internal order is not significant. Use this function for lottery-style probability calculations.

**Syntax** 

PERMUT(number,number chosen)

**Number** is an integer that describes the number of objects.

**Number chosen** is an integer that describes the number of objects in each permutation.

#### Remarks

Both arguments are truncated to integers.

If number or number chosen is nonnumeric, PERMUT returns the #VALUE! error value. If number  $\leq 0$  or if number chosen < 0, PERMUT returns the #NUM! error value. If number < number chosen, PERMUT returns the #NUM! error value.

The equation for the number of permutations is:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

## Example

Suppose you want to calculate the odds of selecting a winning lottery number. Each lottery number contains three numbers, each of which can be between 0 (zero) and 99. inclusive. The following function calculates the number of possible permutations:

图	🛛 Microsoft Excel - Book1

#### LECTURE 35 COMBINATIONS ELEMENTARY PROBABILITY PART 1

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 34
- Combinations
- Elementary Probability

#### **COMBINATIONS**

Arrangements of objects without caring for the order in which they are arranged are called Combinations.

Number of n objects taken r at a time, denoted by nCr or (n) given by (r)

nCr = n!/r!(n-r)!

# **Difference between Combination and Permutation**

Suppose we have to form a number of consisting of three digits using the digits **1,2,3,4**. To form this number the digits have to be *arranged*. Different numbers will get formed depending upon the order in which we arrange the digits. This is an example of *Permutation*.

Now suppose that we have to make a team of 11 players out of 20 players, This is an example of *combination*, because the order of players in the team will not result in a change in the team. No matter in which order we list out the players the team will remain the same! For a different team to be formed at least one player will have to be changed

#### Example

Number of combinations of 3 different objects A, B, C taken two at a time = 3!/2!(3-2)! = 6/2 = 3. These combinations are: AB, AC, and BC.

#### **COMBINATIONS EXAMPLES**

Here are a few examples of combinations which are based on the above formula.

#### Example 3

In how many ways a team of 11 players be chosen from a total of 15 players? n= 15, r = 11

$$\sum_{11}^{15} = \frac{15!}{11!(15-11)!} = \frac{15.14.13.12.11!}{11!(4!)} = \frac{15.14.13.12}{4.3.2.1} = 1365 Ways$$

#### Example 4

There are 5 white balls and 4 black balls. In how many ways can we select 3 white and 2 black balls?

$$\int_{3}^{5} \times \int_{2}^{4} = \frac{5!}{3!(5-3)!} \times \frac{4!}{2!(4-2)!} = 60$$

# Example 5

If a committee of 3 people is to be selected from among 5 married couples so that the committee does not include two people who are married to each other, how many such committees are possible?

# Solution:

Total number of ways of picking 3 out 5 married couples or 10 people = 10C3 = 120

- A set can have any of the five married couples -----> 5

- The third person can be any one of the remaining eight ----> 8 ( one married couple is already part of the chosen set).

so total Number of ways in which the set of three can have a married couple = 5\*8 = 40

number of combinations which don't have any of the married couples. = 10C3 - (5\*8) = 80;

# **RESULTS OF SOME COMBINATIONS**

Here are some important combinations that can simplify the process of calculations for Binomial Expansion. nC0 = nCn = 1e.g., 4C0 = 4C4 = 1nC1 = nCn-1 = ne.g., 4C1 = 4C3 = 4nCr = nCn-re.g., 5C2 = 5C3

## **BINOMIAL EXPANSION**

An expression consisting of two terms joined by + or – sign is called a Binomial Expression. Expressions such as (a+b), (a-b),  $(x+y)^2$  are examples of Binomial Expressions We can verify that:  $(x+y)^{1} = x + y$  $(x+y)^{2} = x^{2} + 2xy + y^{2}$  $(x+y)^{3} = x^{3} + 3x^{2}y + 3xy^{2} + y^{3}$  $(x+y)^{4} = x^{4} + 4x^{3}y + 6x^{2}y^{2} + 4xy^{3} + y^{4}$ Expressions on the right hand side are called Binomial Expansions.

## **COEFFICIENTS OF BINOMIAL EXPANSION**

The coefficients of the binomial expansion for any binomial expression can be written in combinatorial notation:  $(x+y)^{5} = 5C0.x^{5} + 5C1x^{4}y + 5C2x^{3}y^{2} + 5C3x^{2}y^{3} + 5C4xy^{4} + 5C5y^{5}$ Solving:  $= x^{5} + 5x^{4}y + 10x^{3}y^{2} + 10x^{2}y^{3} + 5xy^{4} + y^{5}$ 

## CALCULATION OF BINOMIAL EXPANSION COEFFICIENTS

Coefficient of first and last term is always 1 Coefficient of any other term = (coefficient of previous term).(power of x from previous term)/number of that term **Example** First term =  $x^{5}$ Last term =  $y^{5}$ Second coefficient = 5/1 = 8Third coefficient =  $5^{4}/2 = 10$ Fourth coefficient =  $10^{*}3/3 = 10$ Fifth coefficient =  $10^{*}2/4 = 5$ 

# PROJECT DEVELOPMENT MANAGER'S PROBLEM

A toys manufacturer intends to start development of new product lines. A new toy is to be developed. Development of this toy is tied with a new TV series with the same name. There is 40% chance of TV series. The production in such a case is estimated at 12,000 units. The Profit per toy would be Rs. 2.

Without TV series-sale there may be demand for 2,000 units.

Already 500,000 Rs. has been invested.

A rival may bring to the market a similar toy. If so the sale may be 8000 units. The chance of rival bringing this toy to the market is 50%.

Choices:

The company has two choices:

•Abandon new product

Risk new development

## How should the company tie it all to financial results?

## Sample space, Event

The set of collection of all possible outcomes of an experiment is called the sample space. Each possible outcome of an experiment is called event. Thus an event is a subset of the sample space.

For example all six faces of a die make a sample space. By rolling the dice, occurrence of number 1 is an event.

# Probability

Probability is the numerical measure of the chance that an uncertain event will occur. The probability that the event A will occur is usually denoted by p(A). The probability of any event must be between zero and one inclusive.

For any event A

 $0 \le p(A) \le 1$ 

p(A) = 1 means certain

p(A) = 0 means impossible.

# PROBABILITY EXAMPLE 1

How can we make assessment of chances? Look at a simple example.

A worker out of 600 gets a prize by lottery.

What is the chance of any one individual say Rashid being selected? **Solution:** 

Chance of any one individual say Rashid being selected = 1/600

The probability of the event "Rashid is selected" is the probability of an event occurring=p(Rashid = 1/600)

This is a' priori method of finding probability as we can assess the probability before the event occurred

#### PROBABILITY EXAMPLE 2

When all outcomes are equally likely a' priori probability is defined as: p(event) = Number of ways that event can occur/Total number of possible outcomesIf out of 600 persons 250 are women, then the chance of a women being selected = p(woman) = 250/600

### PROBABILITY - EMPIRICAL APPROACH

In many situations, there is no prior knowledge to calculate probabilities. What is the probability of a machine being defective?

#### Method:

- 1. Monitor the machine over a period of time.
- 2. Find out how many times it becomes defective.

This experimental or empirical approach

## **EXPERIMENTAL AND THEORETICAL PROBABILITY**

p(event) = Number of times event occurs/Total number of experiments. Larger the number of experiments, more accurate the estimate. Experimental probability approaches theoretical probability as the number of experiments becomes very large.

## <u>OR RULE</u>

Consider two events A and B.

What is the probability of either A or B happening?

What is the probability of A and B happening?

What is the number of possibilities?

Probability of A or B happening = Number of ways A or B can happen/ Total number of possibilities

= Number of ways A can happen + number of ways B can happen/ Total number of possibilities

Or

= Number of ways A can happen/ Total number of possibilities + Number of ways B can happen/ Total number of possibilities

= Probability of A happening + Probability of B happening

## Condition for Or Rule

A and B must be mutually exclusive. When A and B are mutually exclusive: p(A or B) = p(A) + p(B) <u>OR RULE EXAMPLE</u> If a dice is thrown what is the chance of getting an **even number** or a number **divisible by three**? **p(even)** = 3/6 **p(div by 3)** = 2/6 **p(even or div by 3)** = 3/6 + 2/6 = 5/6 The number 6 is not mutually exclusive. **Hence:** Correct answer = 4/6

#### AND RULE

Probability of A and B happening = Probability of A x Probability of B **Example** 

In a factory 40% workforce are women. Twenty five percent females are in management grade. Thirty percent males are in management grade. What is the probability that a worker selected is a women from management grade?

# Solution

p(woman chosen) = 2/5 25% females = management grade  $30\% \text{ of males} = \text{management grade} p(woman \& \text{Management grade}) = p(woman) \times p(\text{management})$ Assume that the total workforce = 100 p(woman) = 0.4 p( management) = 0.25  $p(woman) \times p(\text{ management}) = 0.4 \times 0.25 = 0.1 \text{ or } 10\%$  SET OF MUTUALLY EXCLUSIVE EVENTSTo cover all possibilities between mutually exclusive events add up all the probabilities.
Probabilities of all these events together add up to 1. p(A) + p(B) + p(C) + ....p(N) = 1

# EXHAUSTIVE EVENTS

A happens or A does not happen then A and B are Exhaustive Events. p(A happens) + A (does not happen) = 1

The sum of the probabilities of all mutually exclusive and collectively exhaustive events is always equal to 1. That is,

p(A) + p(B) + p(C) = 1

if A, B, C are mutually exclusive and collectively exhaustive events

## Example 1

p(you pass) = 0.9p(you fail) = 1 - 0.9 = 0.1

# EXAMPLE1 - EXHAUSTIVE EVENTS

A production line uses 3 machines. The Chance that  $1^{st}$  machine breaks down in any week is 1/10. The Chance for  $2^{nd}$  machine is 1/20. Chance of  $3^{rd}$  machine is 1/40.What is the chance that at least one machine breaks down in any week? <u>Solution</u> p(at least one not working) + p(all three working) = 1 p(at least one not working) = 1- p(all three working) p(all three working) = p(1st working) x p(2nd working) x p(3rd working) p(1st working) = 1 - p(1st not working) = 1- 1/10 = 9/10 p(2nd working) = 19/20 p(3rd working) = 39/40 p(all working) 9/10 x 19/20 x 39/40 = 6669/8000 p(at least 1 working) = 1 - 6669/8000 = 1331/8000

# **APPLICATION OF RULES**

A firm has the following rules: When a worker comes late there is 1/4 chance that he is caught. First time he is given a warning. Second time he is dismissed. What is the probability that a worker is late three times is not dismissed? Solution Let us use the denominations: 1C: Probability of being Caught first time 1NC: Probability of being Not Caught first time 2C: Probability of being Caught 2nd time 2NC: Probability of being Not Caught 2nd time 3C: Probability of being Caught 3rd time 3NC: Probability of being Not Caught 3rd time Probabilities of different events can be calculated by applying the AND Rule. 1C(1/4) & 2C(1/4) (Dismissed 1) = (1/16 = 4/64)1C(1/4) & 2NC(3/4) & 3C(1/4)(Dismissed 2)(3/64) 1C(1/4) & 2NC(3/4) & 3NC(3/4)(Not dismissed 1)(9/64) 1NC(3/4) & 2C(1/4) & 3C(1/4)(Dismissed 3)(3/64) 1NC(3/4) & 2C(1/4) & 3NC(3/4)(Not dismissed 2)(9/64) 1NC(3/4) & 2NC(3/4) & 3C(1/4)(Not dismissed 3)(9/64) 1NC(3/4) & 2NC(3/4) & 3NC(3/4)(Not dismissed 4)(27/64) p(caught first time but not the second or third time) =  $\frac{1}{4} \times \frac{3}{4} \times \frac{3}{4} = \frac{9}{64}$ p(caught only on second occasion) =  $\frac{3}{4} \times \frac{1}{4} \times \frac{3}{4} = \frac{9}{64}$ p(late three times but not dismissed) = p(not dismissed 1) + p(not dismissed 2) +p(not dismissed 3) + p(not dismissed 4) = 9/64 + 9/64 + 9/64 + 27/64 = 54/64p(caught) using OR Rule p(caught) =p(dismissed 1) + p(dismissed 2) + p(dismissed 3) = 4/64 + 3/64 + 3/64= 10/64p(caught) and p(not caught) using rule about Exhaustive events p(not caught) = 1-p(not caught)= 1 - 10/64

= 54/64

#### LECTURE 36 ELEMENTARY PROBABILITY PART 2

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 35
- Elementary Probability

### PROBABILITY CONCEPTS REVIEW

Most of the material on probability theory along with examples was included in the handout for lecture 35. You are advised to refer to handout 35. Some of the concepts and examples have been further elaborated in this handout.

Probability means making assessment of chances. The simplest example was the probability of Rashid getting the lottery when he was one of 600. The probability of the event was 1/600.

#### PERMUT EXAMPLE

In handout for lecture 35, we looked at the function PERMUT, that can be used for calculations of permutations. An example is shown in the slide

	R N	hicrosoft Excel - B	look1

below.	9							

#### OR RULE REVIEW

When two events are mutually exclusive, the probability of either one of those occurring is the sum of individual probabilities. This is the OR Rule. This is a very extensively used rule.

A and B must be mutually exclusive. The formula for the OR rule is as under. p(A or B) = p(A) + p(B) VU

# Example

If a dice is thrown what is the chance of getting an odd number or a number divisble by three? P(odd) = 3/6p(div by 3) = 2/6p(odd or div by 3) = 3/6 + 2/6 = 5/6The number 6 is not mutually exclusive Hence correct answer = 5/6<u>AND RULE REVIEW</u> The AND Rule requires that the events occur simultaneously.

# **Example**

60% workforce are men. p(man chosen) = 3/5 25% females = management grade 30% of males = management grade What is the probability that a worker selected is a man from management grade?

# Example

p(man & management grade) = p(man) x p(management) Total workforce = 100 p(man) = 0.6 p(management) = 0.3 p(man) x p(management) = 0.6 x 0.3 = 0.18 or 18% <u>SET OF MUTUALLY EXCLUSIVE EVENTS REVIEW</u> Between them they cover all possibilities Probabilities of all the

Between them they cover all possibilities.Probabilities of all these events together add up to 1. Exhaustive Events are events that happen or do not happen.

p(it rains) = 0.9

p(it does not rain) = 1 - 0.9 = 0.1

# Example

In Handout for lecture 35 we studied the problem of the three machines.

A production line uses 3 machines.

Chance that 1<sup>st</sup> machine breaks down in any week was 1/10. Chance for 2<sup>nd</sup> machine was 1/20. Chance of 3<sup>rd</sup> machine was 1/40. What is the chance that at least one machine breaks down in any week?

What are the probabilities?

Probability that one or two or three machines are not working (in other words at least one not working) and that all three areworking add up to 1 as exhaustive events.

P(at least one not working) + p(all three working) = 1

From the above, the probability that at least one is not working is worked out.

P(at least one not working) = 1- p(all three working)

Now to work out the probability that all three are working, we need to think in terms of machine 1 and machine 2 and machine 3 working. This means application of the AND Rule.

p(all three working) = p(1st working) x p(2nd working) x p(3rd working) Now the probability of machine 1 working is not known. The probability that machine 1 is not working is given. These two events (working and not working) are exhaustive events and add up to 1. Thus, the event that machine 1 is working, p(1st working), can be calculated as:

= 1 - p(1st not working) = 1 - 1/10 = 9/10

The calculations for the other machines are:

p(2nd working) = 1-1/20 = 19/20

p(3rd working) = 1 - 1/40 = 39/40

Now the combined probability of p(all working) is a product of their individual probabilities using the AND Rule: =  $9/10 \times 19/20 \times 39/40 = 6669/8000$ Finally P(at least 1 working or ) = 1- 6669/8000 = 1331/8000

#### LECTURE 37 PATTERNS OF PROBABILITY: BINOMIAL, POISSON AND NORMAL DISTRIBUTIONS PART 1

### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 36
- Patterns of Probability: Binomial, Poisson and Normal Distributions

#### MODULE 7

Module 7 covers the following: Factorials Permutations and Combinations (Lecture 34) Elementary Probability (Lectures 35- 36) Patterns of probability: Binomial, Poisson and Normal Distributions Part 1- 4 (Lectures 37- 40)

#### MODULE 8

Module 8 covers the following. Estimating from Samples: Inference (Lectures 41- 42) Hypothesis Testing: Chi-Square Distribution (Lectures 43 - 44) Planning Production Levels: Linear Programming (Lecture 45) Assignment Module 7- 8 End-Term Examination

## EXAMPLE 1

We covered in the past two lectures Elementary Probability. Most of the material was included in Handout 35. Some questions were discussed in detail in handout 36. In lecture 37, the example where the employee was warned on coming late and dismissed if late twice will be discussed. The material for this example is given in handout 35. Here we shall cover the main points and the method.

A firm has the following rules:

When a worker comes late there is 1/4 chance that he is caught First time he is given a warning. Second time he is dismissed.

What is the probability that a worker is late three times is not dismissed?

#### Solution

How do we solve a problem of this nature? The answer is to develop the different options first. Let us see how it can be done.

#### First time

There are two options: Caught: 1C Not Caught: 1NC

#### 2nd time

Caught: 2C Not Caught: 2NC

# 3rd time

Caught: 3C Not Caught: 3NC Look at combinations up to 2<sup>nd</sup> stage

1C&2C 1C& 2NC 1NC& 2C 1NC& 2NC Look at combinations up to 3<sup>rd</sup> stage 1C&2C&3C 1C & 2NC & 3C 1C & 2NC & 3NC 1NC & 2C & 3C 1NC & 2C & 3NC 1NC & 2NC & 3C 1NC & 2NC & 3NC You saw that the first case is 1C & 2C. Here the employee was caught twice and was dismissed. He can not continue. Hence this case was closed here. In other cases, the combinations were as given above. Now the probability of being caught was 1/4. As an exhaustive event the probability of not being caught was  $1 - \frac{1}{4} = \frac{3}{4}$ . Now the probabilities can be calculated as follows: 1C & 2C (1/4X1/4 = 1/16)1C & 2NC & 3C (1/4X 3/4X1/4 = 3/64) 1C & 2NC & 3NC (1/4X3/4X3/4 = 9/64) 1NC & 2C & 3C (3/4x1/4x1/4 = 3/64)1NC & 2C & 3NC (3/4x1/4X3/4 = 9/64) 1NC & 2NC & 3C (3/4x3/4x1/4 = 9/64)1NC & 2NC & 3NC (3/4x3/4x3/4 = 27/64) The probabilities for each combination of events are now summarized below: First Caught, Second Caught, Dismissed: 1C (1/4) & 2C (1/4) (Dismissed 1) (1/16 = 4/64) First caught, Second Not Caught, 3rd Caught, Dismissed: 1C (1/4) & 2NC (3/4) & 3C (1/4) (Dismissed 2) (3/64) First caught, Second Not Caught, 3<sup>rd</sup> Not Caught, Not Dismissed 1C (1/4) & 2NC (3/4) & 3NC (3/4) (Not dismissed 1) (9/64) First Not Caught, Second Caught, 3rd Caught, Dismissed 1NC (3/4) & 2C (1/4) & 3C (1/4) (Dismissed 3) (3/64) First Not caught. Second Caught. 3rd Not Caught. Not Dismissed 1NC (3/4) & 2C (1/4) & 3NC (3/4) (Not dismissed 2) (9/64) First caught, Second Not Caught, 3rd Caught, Not Dismissed 1NC (3/4) & 2NC (3/4) & 3C (1/4) (Not dismissed 3) (9/64) First caught, Second Not Caught, 3<sup>rd</sup> Not Caught, Not Dismissed 1NC (3/4) & 2NC (3/4) & 3NC (3/4) (Not dismissed 4) (27/64) **Probabilities** p(caught) =The probability of being caught can be calculated by thinking that these are mutually events. All situations where there was a dismissal can be considered. Probability(caught) = p(dismissed 1) + p(dismissed 2) + p(dismissed 3) = 4/64 + 3/64 + 3/64= 10/64

# p(not caught) =

Once we have the probability of being caught we can find out the probability of not being caught as an exhaustive event. Thus:

p(not caught)

= 1- p(caught)

= 1 - 10/64

= 54/64

# EXAMPLE 2

Two firms compete for contracts. A has probability of  $\frac{3}{4}$  of obtaining one contract. B has probability of  $\frac{1}{4}$ . What is the probability that when they bid for two contracts, firm A will obtain either the first or second contract? <u>Solution:</u> P(A gets first or A gets second) =  $\frac{3}{4} + \frac{3}{4} = \frac{6}{4}$ Wrong! Probability greater than 1! We ignored the restriction: events must be mutually exclusive. We are looking for probability that A gains the first or second or both. We are not interested in B getting both the contracts p(B gets first) x p(B gets both) =  $\frac{1}{4} \times \frac{1}{4} = \frac{1}{16}$ .

# **Alternative Method**

Split "A gets first or the second or both" into 3 parts A gets first but not second =  $\frac{3}{4} \times \frac{1}{4} = \frac{3}{16}$ A does not get first but gets second =  $\frac{1}{4} \times \frac{3}{4} = \frac{3}{16}$ A gets both =  $\frac{3}{4} \times \frac{3}{4} = \frac{9}{16}$ P(A gets first or second or both) =  $\frac{3}{16} + \frac{3}{16} + \frac{9}{16} = \frac{15}{16}$ 

# EXAMPLE 3

In a factory 40% workforce is female. 25% females belong to the management cadre. 30% males are from management cadre. If management grade worker is selected, what is the probability that it is a female? Draw up a table first.

	Male	Female	Total
Management	?	?	?
Non-Management	?	?	?
Total	?	40	100

# **Calculate**

Total male = 100 - 40 = 60Management female =  $0.25 \times 40 = 10$ Non-Management female = 40 - 10 = 30Management male =  $0.3 \times 60 = 18$ Non-Management male = 60 - 18 = 42Management total = 18 + 10 = 28Non-Management total = 42 + 30 = 72SummaryMale Female TotalManagement 18 10 28

 100

p(management grade worker is female) =10/28

#### EXAMPLE 4

A pie vendor has collected data over sale of pies. This data is organized as follows: No. Pies sold Income(X) % Davs(f) fX Rs.

les	sola	Income(X)	% Days(f)	TX RS.
40	x 35	= 1400	20	28000
50		1750	20	35000
60		2100	30	63000
70		2450	20	49000
80		2800	10	28000
	Т	otal	100	203000
	M	ean/day = 2	03000/100	= 2030

The selling price per pie was Rs. 35. What was the mean sale per day?

Such a question can be solved by calculating the sale in each slab and then dividing the total sale by number of pies.

% days is the probability. If multiplied with the income from each pie, the expected sale from all pies can be calculated. The overall expected value was 203,000. When divided by the number of days (100) an average of 2,030 Rs. Per day was obtained as average sale per day.

## EXPECTED VALUE

EMV =  $\sum$  (probability of outcome x financial result of outcome)

## **Example**

In an insurance company 80% of the policies have no claim. In 15% cases the Claim is 5000 Rs. For the remaining 5% the Claim is 50000 Rs. What is the Expected value of claim per policy? Applying the formula above:  $EMV = 0.8 \times 0 + 0.15 \times 5000 + 0.05 \times 50000$ = 0 + 750 + 2500= 3250 Rs.

# TYPICAL PRODUCTION PROBEM

In a factory producing biscuits, the packing machine breaks 1 biscuit out of twenty (p = 1/20 = 0.05). What proportion of boxes will contain more than 3 broken biscuits? This is a typical Binomial probability situation! The individual biscuit is broken or not = two possible outcomes

## **Conditions for Binomial Situation**

- 1. Either or situation
- 2. Number of trials (n) known and fixed
- 3. Probability for success on each trial (p) is known and fixed

# **CUMULATIVE BINOMIAL PROBABILITIES**

The Cumulative Probability table gives the probability of r or more successes in n trials, with the probability p of success in one trial In the table: The total number of trials n = 1 to 10 The number of successes r = 1 to 10 The probability p = 0.05, 0.1, 0.2, 0.25, 0.3, 0.35, 0.4, 0.45, 0.5

#### LECTURE 38 PATTERNS OF PROBABILITY: BINOMIAL, POISSON AND NORMAL DISTRIBUTIONS PART 2

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 37
- Patterns of Probability: Binomial, Poisson and Normal Distributions

### CUMULATIVE BINOMIAL PROBABILITIES

Probability of r or more successes in n trials with the probability of success in each trial

- Look in column for n
- Look in column for r
- Look at column for value of p(0.05 to 0.5)

In other words a cumulative binomial probability refers to the probability that the binomial random variable falls within a specified range (e.g., is greater than or equal to a stated lower limit and less than or equal to a stated upper limit).

For example, we might be interested in the cumulative binomial probability of obtaining 45 or fewer heads in 100 tosses of a coin (see Example 1 below). This would be the sum of all these individual binomial probabilities.

 $b(x \le 45; 100, 0.5) = b(x = 0; 100, 0.5) + b(x = 1; 100, 0.5) + ... + b(x = 44; 100, 0.5) + b(x = 45; 100, 0.5)$ 

You can calculate these values by using the formula  $P(x \le c) = \sum_{c=0}^{x} {n \choose x} P^{x} (1-P)^{n-x}$ 

Or directly from the table.

#### Example:

The probability that a student is accepted to a prestigious college is 0.3. If 5 students from the same school apply, what is the probability that at most 2 are accepted?

#### Solution:

To solve this problem, we compute 3 individual probabilities,

Using the binomial formula. The sum of all these probabilities is the answer we seek. Thus,

b(x < 2; 5, 0.3) = 0.837

Table: Cumulative Binomial probabilities

$P[X \le c] = \sum_{x=0}^{c}$	$\binom{n}{x}p^{x}(1-p)^{n-x}$

## **BINOMDIST**

Returns the individual term binomial distribution probability. Use BINOMDIST in problems with a fixed number of tests or trials, when the outcomes of any trial are only success or failure, when trials are independent, and when the probability of success is constant throughout the experiment. For example, BINOMDIST can calculate the probability that two of the next three babies born are male.

#### Syntax

## BINOMDIST(number\_s,trials,probability\_s,cumulative)

**Number\_s** is the number of successes in trials.

**Trials** is the number of independent trials.

**Probability\_s** is the probability of success on each trial.

**Cumulative** is a logical value that determines the form of the function. If cumulative is TRUE, then BINOMDIST returns the cumulative distribution function, which is the probability that there are at most number\_s successes; if FALSE, it returns the probability mass function, which is the probability that there are number\_s successes.

#### Remarks

Number\_s and trials are truncated to integers.

If number\_s, trials, or probability\_s is nonnumeric, BINOMDIST returns the #VALUE! error value.

If number\_s < 0 or number\_s > trials, BINOMDIST returns the #NUM! error value.

If probability\_s < 0 or probability\_s > 1, BINOMDIST returns the #NUM! error value.

The binomial probability mass function is:

$$b(x; n, p) = {n \choose x} p^{x} (1-p)^{n-x}$$
  
where:  
$${n \choose x},$$

The cumulative binomial distribution is:

$$B(x;n,p) = \sum_{y=0}^{n} b(y;n,p)$$

# EXAMPLE 1

The probability of wet days is 60%. Note that the figure 0.6 is beyond the maximum value 0.5 as given in the tables. Let us first convert our problem to p(dry) = 1 - 0.6 = 0.4. Now p(5 or more wet days) can be restated as p(2 or less dry days). The BINOMDIST function is for p(r or more). Let us convert p(2 or less dry days) to 1 - p(3 or more days). Now the value of n = 7, r = 3 and p = 0.4.

Using BINOMDIST, the answer is 0.4199. Note that the value of cumulative was TRUE.

# EXAMPLE 2

In a transmission where 8 bit message is transmitted electronically there is 10% probability of one bit being transmitted erroneously? What is the chance that entire message is transmitted correctly)?

We can state that the probability required is for 0 successes (errors) in 8 trials (bits). p(one bit transmitted erroneously) = 0.1

P(x=0; 8; p=0.1) = 0.430

For exact binomial distribution

$$P(x=n) = \binom{n}{x} P^{x} (1-P)^{n-x} = \binom{8}{0} 0.1^{0} (1-0.1)^{8-0} = 0.430$$

## Calculation using BINOMDIST

Here the question was inverted.

We had to find 7 successes out of 9. The probability was 75% for success. It becomes 25% for failure. Now let us restate the problem in terms of failure. We are interested in 7 or more successes. It means 2 or less failures.

Now the BINOMDIST function gives us at most r successes. In other words 2 or less. Hence if we specify r = 2, we get the answer 0.6007 directly.

## NEGATIVE BINOMIAL DISTRIBUTION

A negative binomial experiment is a statistical experiment that has the following properties:

- The experiment consists of *x* repeated trials.
- Each trial can result in just two possible outcomes. We call one of these outcomes a success and the other, a failure.
- The probability of success, denoted by *P*, is the same on every trial.
- The trials are independent; that is, the outcome on one trial does not affect the outcome on other trials.
- The experiment continues until *r* successes are observed, where *r* is specified in advance.

Consider the following statistical experiment. You flip a coin repeatedly and count the number of times the coin lands on heads. You continue flipping the coin until it has landed 5 times on heads. This is a negative binomial experiment because:

- The experiment consists of repeated trials. We flip a coin repeatedly until it has landed 5 times on heads.
- Each trial can result in just two possible outcomes heads or tails.
- The probability of success is constant 0.5 on every trial.
- The trials are independent; that is, getting heads on one trial does not affect whether we get heads on other trials.
- The experiment continues until a fixed number of successes have occurred; in this case, 5 heads.

**Negative Binomial Formula.** Suppose a negative binomial experiment consists of *x* trials and results in *r* successes. If the probability of success on an individual trial is *P*, then the negative binomial probability is:

 $b^{*}(x; r, P) = {}_{x-1}C_{r-1} * P^{r} * (1 - P)^{x-r}$ 

## Example

Bob is a high school basketball player. He is a 70% free throw shooter. That means his probability of making a free throw is 0.70. During the season, What is the probability that Bob makes his first free throw on his fifth shot?

#### Solution:

This is an example of a geometric distribution, which is a special case of a negative binomial distribution. Therefore, this problem can be solved using the negative binomial formula or the geometric formula. We demonstrate each approach below, beginning with the negative binomial formula.

The probability of success (P) is 0.70, the number of trials (x) is 5, and the number of successes (r) is 1. We enter these values into the negative binomial formula.

 $b^{*}(x; r, P) = {}_{x-1}C_{r-1} * P^{r} * Q^{x-r}$ 

 $b^{*}(5; 1, 0.7) = {}_{4}C_{0} * 0.7^{1} * 0.3^{4}$ 

b\*(*5*; *3*, *0*.*7*) = 0.00567

# **NEGBINOMDIST**

Returns the negative binomial distribution. NEGBINOMDIST returns the probability that there will be number\_f failures before the number\_s-th success, when the constant probability of a success is probability\_s. This function is similar to the binomial distribution, except that the number of successes is fixed, and the number of trials is variable. Like the binomial, trials are assumed to be independent.

For example, you need to find 10 people with excellent reflexes, and you know the probability that a candidate has these qualifications is 0.3. NEGBINOMDIST calculates the probability that you will interview a certain number of unqualified candidates before finding all 10 qualified candidates.

# Syntax

# NEGBINOMDIST(number\_f,number\_s,probability\_s)

**Number\_f** is the number of failures.

**Number\_s** is the threshold number of successes.

**Probability\_s** is the probability of a success.

## Remarks

- **Number\_f** and **number\_s** are truncated to integers.
- If any argument is nonnumeric, NEGBINOMDIST returns the #VALUE! error value.
- If probability\_s < 0 or if probability > 1, NEGBINOMDIST returns the #NUM! error value.
- If  $(number_f + number_s 1) \le 0$ , NEGBINOMDIST returns the #NUM! error value.
- The equation for the negative binomial distribution is:

$$nb(x;r,p) = {x+r-1 \choose r-1} p'(1-p)''$$

where:

x is number\_f, r is number\_s, and p is probability\_s.

# **NEGBINOMDIST-EXAMPLE**

You need to find 10 people with excellent reflexes, and you know the probability that a candidate has these qualifications is 0.3

NEGBINOMDIST calculates the probability that you will interview a certain number of unqualified candidates before finding all 10 qualified candidates.

# **CRITBINOM**

Returns the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value. Use this function for quality assurance applications. For example, use CRITBINOM to determine the greatest number of defective parts that are allowed to come off an assembly line run without rejecting the entire lot.

# Syntax

## CRITBINOM(trials,probability\_s,alpha)

**Trials** is the number of Bernoulli trials.

**Probability\_s** is the probability of a success on each trial.

Alpha is the criterion value.

# Remarks

If any argument is nonnumeric, CRITBINOM returns the #VALUE! error value.

If trials is not an integer, it is truncated.

If trials < 0, CRITBINOM returns the #NUM! error value.

If probability\_s is < 0 or probability\_s > 1, CRITBINOM returns the #NUM! error value. If alpha < 0 or alpha > 1, CRITBINOM returns the #NUM! error value.

# **Example**

# EXPECTED VALUE EXAMPLE

A lottery has 100 Rs. Payout on average 20 turns.

Is it worthwhile to buy the lottery if the ticket price is 10 Rs.?

Expected win per turn =  $p(\text{winning}) \times \text{gain per win} + p(\text{losing}) \times \text{loss if you loose}$ 

- = 1/20 x (100 10) + 19/20 x (- 10) Rs.
- = 90/20 190/20 Rs.
- = 4.5 9.5 = 5 Rs.

So on an average you stand to loose 5 Rs.

## **DECISION TABLES**

Look at the data in the table below:

No. of Pies demanded % Occasions

25	10
30	20
35	25
40	20
45	15
50	10

Price per pie = Rs. 15

Refund on return = Rs. 5

Sale price = Rs. 25

Profit per pie = Rs. 25 - 15 = Rs. 10Loss on each return = Rs. 15 - 5 = Rs. 10

How many pies should be bought for best profit?

To solve such a problem, a decision table is set up as shown below. The values in the first column are number of pies to be purchased. Figures in columns are the sale with % share of sale within brackets. If the number of pies bought is less than the number that can be sold, the number of pies sold remains constant. If the number of pies bought exceeds the number of pies sold then the remaining are returned. This means a loss. For every value the sum of profit for sale and loss for pies returned is calculated.

The average sale for each row is calculated by multiplying the profit for each sale with % sale in the column. An example calculation is given as a guide for 30 pies.

## DECISION TABLES

	25(0	.1) 30(	0.2)	35(0.25)	40(0.2)	45(0.15)	50(0.1)	EMV	
25	250	250		250	250	250	250	250	
30	200	300		300	300	300	300	290	
35	150	250		350	350	350	350	310	
Buy									
40	100	200		300	400	400	400	305	
45	50	150		250	350	450	450	280	
		0	100		200	300	400	500	240

# Expected profit 30 pies

= 0.1 x 200 + 0.2 x 300 + 0.25 x 300 + 0.2 x 300 + 0.15 x 300 + 0.1 x 300

= 20 + 60 + 75 + 60 + 45 + 30

= 290 Rs.

#### **Best Profit**

It may be noted that the best profit is for 35 Pies = Rs. 310

# DECISION TREE TOY MANUFACTURING CASE

The problem of the manufacturer intending to start manufacturing a new toy under the conditions that the TV series may or may not appear, that the rival may or may not sell a similar toy is now solved below.

Here a Decision tree has been developed with the possible branches as shown below. Each sequence represents an application of the AND rule.

1A Abandon

1B Go ahead >2A: Series appears (60%)

>2B: No series (40%) >2A>3A: Rival markets (50%) >2A>3B: No Rival (50%)

# **Production**

Series, no rival = 12000 units Series, rival = 8000 units No series = 2000 units Investment = Rs. 500000 Profit per unit = Rs. 200 Loss if abandon = Rs. 500000 What is the best course of action? Profit if rival markets, series appears =  $8000 \times 200 - 500000 = 1600000 - 500000 = 1100000 \text{ Rs.}$ Profit if no rivals =  $12000 \times 200 - 500000 = 2400000 - 500000 = 1900000 \text{ Rs.}$ Profit/Loss if no series =  $2000 \times 200 - 500000 = 400000 - 500000 = -100000 \text{ Rs.}$  (No series) EMV = Rival markets and no rivals =  $0.5 \times 1100000 + 0.5 \times 1900000 = 1500000$  (Series) EMV =  $0.6 \times 1500000 + 0.4 \times -100000 = 900000 - 400000 = 860000 \text{ Rs.}$ 

# **Conclusion**

It is clear that in spite of the uncertainty, there is a likelihood of a reasonable profit. Hence the conclusion is: Go ahead

# THE POISSON DISTRIBUTION

The Poisson distribution is most commonly used to model the number of random occurrences of some phenomenon in a specified unit of space or time. For example,

- The number of phone calls received by a telephone operator in a 10-minute period.
- The number of flaws in a bolt of fabric.
- The number of typos per page made by a secretary.

It has the following characteristics:

Either or situation No data on trials No data on successes Average or mean value of successes or failures This is a typical Poisson Situation.

# **Characteristics**

- Either/or situation
- Mean number of successes per unit, m, known and fixed
- p, chance, unknown but small, (event is unusual)

For a Poisson random variable, the probability that X is some value x is given by the formula

$$P(X = x) = \frac{\mu^{x} e^{-\mu}}{x!}, \quad x = 0, 1, \dots$$

where  $\mu$  is the average number of occurrences in the specified interval. For the Poisson distribution,

$$E(X) = \mu$$
,  $Var(X) = \mu$ 

# Example:

The number of false fire alarms in a suburb of Houston averages 2.1 per day. Assuming that a Poisson distribution is appropriate, the probability that 4 false alarms will occur on a given day is given by

$$P(X=4) = \frac{2.1^4 e^{-2.1}}{4!} = 0.0992$$

## THE POISSON TABLES OF PROBABILITIES

Gives cumulative probability of r or more successes Knowledge of m is required. Table gives the probability of that r or more random events are contained in an interval when the average number of events per interval is m

## Example 2

Attendance in a factory shows 7 absences. What is the probability that on a given day there will be more than 8 people absent? <u>Solution</u>

#### Method 1

$$P(X > 8) = 1 - P(X \le 8) = 1 - [P(x = 1) + P(x = 2) + P(x = 3) + P(x = 4) + P(x = 5) + P(x = 6) + P(x = 7) + P(x = 8)]$$

$$=1-\left[\frac{7^{1}e^{1}}{1!}+\frac{7^{2}e^{2}}{2!}+\frac{7^{3}e^{3}}{3!}+\frac{7^{4}e^{4}}{4!}+\frac{7^{5}e^{5}}{5!}+\frac{7^{6}e^{6}}{1!}+\frac{7^{7}e^{7}}{7!}+\frac{7^{8}e^{8}}{7!}\right]$$
  
= 1- [0.0064+0.0223+0.0521+0.0912+0.1277+0.149+0.149+0.1304]  
=0.2709

Method 2

 $\overline{P(X > 8)} = 1 - P(X \le 8) = 1 - 0.7291 = 0.2709$ 

300

## p(9 or more successes) = 0.2709

# Cumulative Poisson Distribution Table

Table shows cumulative probability functions of Poisson Distribution with various  $\alpha$ . Example: to find the probability  $P(X \le 3)$  where X has a Poisson Distribution with  $\alpha = 2$ , look in row 4 and column 4 to find  $P(X \le 3)=0.8571$  where X is Poisson(2).

#### Example 4

An automatic packing machine produces on an average one in 100 underweight bags. What is the probability that 500 bags contain less than three underweight bags? Solution  $m = 1 \times 500/100 = 5$ 

 $p(x<3, \alpha = 5) = p(x<=2, \alpha = 5) = 0.1247=12.47\%$ 

# Cumulative Poisson Distribution Table

Table shows cumulative probability functions of Poisson Distribution with various  $\alpha$ . Example: to find the probability  $P(X \le 3)$  where X has a Poisson Distribution with  $\alpha = 2$ , look in row 4 and column 4 to find  $P(X \le 3)=0.8571$  where X is Poisson(2).

#### LECTURE 40 PATTERNS OF PROBABILITY: BINOMIAL, POISSON AND NORMAL DISTRIBUTIONS PART 4

## **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 39
- Patterns of Probability: Binomial, Poisson and Normal Distributions Part 4

#### **POISSON WORKSHEET FUNCTION**

Returns the Poisson distribution. A common application of the Poisson distribution is predicting the number of events over a specific time, such as the number of cars arriving at a toll plaza in 1 minute.

## Syntax

#### **POISSON**(x,mean,cumulative)

X is the number of events.

Mean is the expected numeric value.

Cumulative is a logical value that determines the form of the probability distribution returned. If cumulative is TRUE, POISSON returns the cumulative Poisson probability that the number of random events occurring will be between zero and x inclusive; if FALSE, it returns the Poisson probability mass function that the number of events occurring will be exactly x.

#### Remarks

- If x is not an integer, it is truncated.
- If x or mean is nonnumeric, POISSON returns the #VALUE! error value.
- If  $x \le 0$ , POISSON returns the #NUM! error value.
- If mean ≤ 0, POISSON returns the #NUM! error value.
- POISSON is calculated as follows.

For cumulative = FALSE:

$$POISSON = \frac{e^{-\lambda} \lambda^{x}}{x!}$$
  
For cumulative = FALSE:  
$$CUMPOISSON = \sum_{k=0}^{x} \frac{e^{-\lambda} \lambda^{k}}{k!}$$

## **Example**

An application of the POISSON function is shown below. In this slide the value of Cumulative was TRUE. It means that the probability is for at the most case.

#### THE PATTERN

In Binomial and Poisson the situations are: either/or Number of times could be counted.

In the Candy problem with underweight boxes, there is measurement of weight.

Binomial and Poisson are discrete probability distributions.

Candy problem is a Continuous probability distribution. Such problems need a different treatment.

## FREQUENCY BY WEIGHT

Look at the frequency distribution of weight of sample bags.

Frequency distribution graph of the sample is shown below. You may see a distinct shape in the graph. It appears to be symmetrical.

The shape of the distribution is that of a Normal Distribution as shown as New distribution in the slide below. On this slide you also see a Standard Normal Distribution with 0 mean and standard deviations 1, 2, 3, 4 etc.

## NORMAL DISTRIBUTION

The blue Curve is a typical Normal Distribution.

A standard normal distribution is a distribution with mean = 0 and standard deviation = 1.

The Y-axis gives the probability values.

The X-axis gives the z (measurement) values.

Each point on the curve corresponds to the probability p that a measurement will yield a particular z value (value on the x-axis.).

Probability is a number from 0 to 1. Percentage probabilities –multiply p by 100. Area under the curve must be one. Note how the probability is essentially zero for any value z that is greater than 3 standard deviations away from the mean on either side.

Mean gives the peak of the curve. Standard deviation gives the spread.

## Weight distribution case

Mean = 510 g StDev = 2.5 g What proportion of bags weighs more than 515 g? Proportion of area under the curve to the right of 515 g gives this probability

# AREA UNDER THE STANDARD NORMAL CURVE

The normal distribution table gives the area under one tail only. <u>z-value</u> Ranges between 0 and 4 in first column. Ranges between 0 and 0.09 in other columns.

#### **Example**

Find area under one tail for z-value of 2.05.

- Look in column 1. Find 2.0.
- Look in column 0.05 and go to intersection of 2.0 and 0.05.

2.1	.4821	.4826	.4830	4834	4838	4842	.4846	.4850	.4854	.4857
2.1	4861	1864	1969	4971	4975	4979	4991	4884	4997	480(

You can find the probability 0.4798 at the intersection of 2.0 and 0.05. (i.e. 2.5 which is corresponding z-value).

As the probability at right from the center of the curve is 0.5 and also at left is 0.5.

Now if we want to find the probability corresponding to z value greater than equal to 2.5, then we have to subtract the value of probability correspond to given z value from 0.5.

0.5 - 0.4798 = 0.0202 = 2.02%

# **CALCULATING Z- VALUES**

z = (Value x – Mean)/StDev Process of calculating z from x is called Standardization. z indicates how many standard deviations the point is from the mean

#### Example 1

Find proportion of bags which have weight in excess of 515 g. Mean = 510. StDev = 2.5 g Solution z = (515 - 510)/2.5 = 2

From tables: probability corresponding to z value is 0.4772

=0.5+0.2881=0.7881

What percentage of bags weigh between 512 and 515? z1 = (512 - 510)/2.5 = 0.8

## **Solution**

Area 1 = 0.2119z2 = (515 - 510)/2.5 = 2Area 2 = 0.02275p(bags weighs between 512 and 515) = Area 1 - Area 2 = 0.2119 - 0.02275= 0.18915 = 18.9%

Area1 = 0.5-0.2881=0.2119 CUMULATIVE NORMAL FREQUENCY DISTRIBUTION (area under standard normal curve from 0 to Z) 0 Z=0.8 Z=2 0.5 0.5 Area 2 =0.5-0.4772=0.0228 CUMULATIVE NORMAL FREQUENCY DISTRIBUTION (area under standard normal curve from 0 to Z) Q Z=0.8 Z=2 0.5 0.5 4.7

= 0.2119 - 0.0228 = 0.1891 = 18.91%

So we obtain

#### LECTURE 41 ESTIMATING FROM SAMPLES: INFERENCE PART 1

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 40
- Estimating from Samples: Inference

# NORMDIST

Returns the normal distribution for the specified mean and standard deviation. This function has a very wide range of applications in statistics, including hypothesis testing. **Syntax** 

# NORMDIST(x,mean,standard\_dev,cumulative)

**X** is the value for which you want the distribution.

Mean is the arithmetic mean of the distribution.

**Standard\_**dev is the standard deviation of the distribution.

**Cumulative** is a logical value that determines the form of the function. If cumulative is TRUE, NORMDIST returns the cumulative distribution function; if FALSE, it returns the probability mass function.

# Remarks

- If mean or standard\_dev is nonnumeric, NORMDIST returns the #VALUE! error value.
- If standard\_dev ≤ 0, NORMDIST returns the #NUM! error value.
- If mean = 0, standard\_dev = 1, and cumulative = TRUE, NORMDIST returns the standard normal distribution, NORMSDIST.
- The equation for the normal density function (cumulative = FALSE) is:

$$f(x;\mu,\sigma) = \frac{1}{\sqrt{2\pi\sigma}}e^{-\left(\frac{(x-\mu)^2}{2\sigma^2}\right)}$$

• When cumulative = TRUE, the formula is the integral from negative infinity to x of the given formula.

# <u>Example</u>

In the slide the x value is 42. Arithmetic mean is 40. Standard deviation is 1.5. The cumulative distribution is 0.9.

9		

# NORMSDIST

Returns the standard normal cumulative distribution function. The distribution has a mean of 0 (zero) and a standard deviation of one. Use this function in place of a table of standard normal curve areas.

# Syntax

# NORMSDIST(z)

z is the value for which you want the distribution.

# Remarks

If z is nonnumeric, NORMSDIST returns the #VALUE! error value.

The equation for the standard normal density function is:

# Example

The input to the NORMSDIST function is the z-value. The output is the cumulative probability distribution. In the example z = 1.333333. The normal cumulative probability function is 0.908789.

17		

# NORMINV

Returns the inverse of the normal cumulative distribution for the specified mean and standard deviation.

# Syntax

# NORMINV(probability,mean,standard\_dev)

**Probability** is a probability corresponding to the normal distribution.

Mean is the arithmetic mean of the distribution.

**Standard\_dev** is the standard deviation of the distribution.

## <u>Remarks</u>

If any argument is nonnumeric, NORMINV returns the #VALUE! error value.

If probability < 0 or if probability > 1, NORMINV returns the #NUM! error value.

If standard\_dev ≤ 0, NORMINV returns the #NUM! error value.

If mean = 0 and standard\_dev = 1, NORMINV uses the standard normal distribution (see NORMSINV).

NORMINV uses an iterative technique for calculating the function. Given a probability value, NORMINV iterates until the result is accurate to within  $\pm$  3x10<sup>-7</sup>. If NORMINV does not converge after 100 iterations, the function returns the #N/A error value.

## Example

Here the probability value, arithmetic mean and standard deviation are given. The answer is the x-value.

R N	Aicrosoft Excel - Lec	ture_41

26	<sup>26</sup> =NORMINV(A23;A24;A25)										
27	27 Inverse of the normal cumulative										
28	<sup>28</sup> distribution for the terms above (42)										

# NORMSINV

Returns the inverse of the standard normal cumulative distribution. The distribution has a mean of zero and a standard deviation of one.

# Syntax

# NORMSINV(probability)

Probability is a probability corresponding to the normal distribution. **Remarks** 

• If probability is nonnumeric, NORMSINV returns the #VALUE! error value.

• If probability < 0 or if probability > 1, NORMSINV returns the #NUM! error value. NORMSINV uses an iterative technique for calculating the function. Given a probability value, NORMSINV iterates until the result is accurate to within  $\pm$  3x10<sup>-7</sup>. If NORMSINV does not converge after 100 iterations, the function returns the #N/A error value.

## Example

In this case, the input is the z-value. The corresponding cumulative distribution is calculated.

# SAMPLING VARIATIONS

Electronic components are despatched by a manufacturer in boxes of 500.

A small number of faulty components are unavoidable.

Customers have agreed to a defect rate of 2%.

One customer recently found 25 faulty components (5%) in a box.

Was this box representative of production as a whole?

The box represents a sample from the whole output. In such a case sampling variations are expected

If overall proportion of defective items has not increased, just how likely is it that a box of 500 with 25 defective components will occur?

# SAMPLING VARIATIONS EXAMPLE 1

In a section of a residential colony there are 6 households say Household A, B, C, D, E and F. A survey is to be carried out to determine % of households who use corn flakes (cf) in breakfast.

Survey data exists and the following information is available:

Households A, B, C and D: Use corn flakes

Households E and F: Do not

It was decided to take random samples of 3 households

The first task is to list all possible samples and find % of each sample using corn flakes. Possible Samples

Sample % cf	users Sample		% cf users
ABC	100	BCD	100
ABD	100	BCE	67
ABE	67	BCF	67
ABF	67	BDE	67
ACD	100	BDF	67
ACE	67	BEF	33
ACF	67	CDE	67
ADE	67	CDF	67
ADF	67	CEF	33
AEF	33	DEF	33
Percentage Ir	n Sample		

Out of 20 samples: 4 contain 100% cf users, 12 contain 67% cf users, 4 contain 33% cf users, with required characteristic If the samples are selected randomly, then each sample is likely to arise. The probability of getting a sample with 100% cf users is: 4/20 or 0.2 with 67% : 12/20 or 0.6 with 33% : 4/20 or 0.2 This is a **Sampling Distribution**.

## SAMPLING DISTRIBUTION

The sampling distribution of percentages is the distribution obtained by taking all possible samples of fixed size n from a population, noting the percentage in each sample with a certain characteristic and classifying these into percentages

#### Mean of the Sampling Distribution

Using the above data:

Mean =  $100\% \times 0.2 + 67\% \times 0.6 + 33\% \times 0.2 = 67\%$ Mean of the sampling distribution is the true percentage for the population as a whole. You must make allowance for variability in samples. <u>Conditions For Sample Selection</u>

•Number of items in the sample, n, is fixed and known in advance

•Each item either has or has not the desired characteristic

•The probability of selecting an item with the characteristic remains constant and is known to be P percent

If n is large (>30) then the distribution can be approximated to a normal distribution **STANDARD ERROR OF PERCENTAGES** 

Standard deviation of the sampling distribution tells us how the sample values differ from the mean P.

It gives us an idea of error we might make if we were to use a sample value instead of the population value.

For this reason it is called STandard Error of Percentages or STEP.

#### **STEP**

The sampling distribution of percentages in samples of n items (n>30) taken at random from an infinite population in which P percent of items have characteristic X will be:

# A Normal Distribution

with mean P%

and standard deviation (STEP)= [P(100-P)/n]^1/2 %

The mean and StDev of the sampling distribution of percentages will also be percentages.

#### LECTURE 42 Estimating from Samples: Inference Part 2

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 41
- Estimating from Samples: Inference

## EXAMPLE 1

In a factory 25% workforce is women.

How likely is it that a random sample of 80 workers contains 25 or more women?

# Solution:

standard deviation (STEP)= [P(100-P)/n]^(1/2) %

Mean = P = 25

N = 80

STEP = [25(100 - 25)/80]^(1/2)%

= [(25 x 75)/80]^(1/2)%

= 4.84%

% women in sample = (25/80) x 100 %= 31.25%

z = (31.25 - 25)/4.84

Look for p against z = 1.29 in the table, you will get 0.4015.

Since we want to find p(sample contains 25 or more women), so

p(sample contains 25 or more women) = 0.5 - 0.4015=0.0985 or about 10%.

## APPLICATIONS OF STEP

Some important issues are:

- What is the probability that such a sample will arise?
- How to estimate the percentage P from information obtained from a single sample?
- How large a sample will be required in order to estimate a population percentage with a given degree of accuracy?
- To obtain answers to these questions, let us solve some typical problems.

## CONFIDENCE LIMITS

A market researcher wishes to conduct a survey to determine % consumers buying the company's products.

He selects a sample of 400 consumers at random.

He finds that 280 of these (70%) are purchasers of the product.

What can he conclude about % of all consumers buying the product?

First let us decide some limits.

It is common to use 95% confidence limits.

These will be symmetrically placed around the 70% buyers.

In a normal sampling distribution 2.5% corresponds to a z-value of 1.96 on either side of 70%.

With 95% confidence limit we have 5% chance of errors (level of significance) That mean 2.5% on each side of curve.

2.5% = 0.025

0.5 - 0.025 = 0.475

We have subtracted 0.025 from 0.5 because we find out the probability of acceptance region ( as the total probability under the curve is always 1, that mean 0.5 on right side of mean and 0.5 on left side of mean. And 0.25 is rejection region so 0.475 is acceptance region).

So 0.475 is the probability of acceptance region.

1.5	.4332	.4345	.4357	.4370	.4382	.4394	.4406	.4418	.4429	.444
1.6	.4452	.4463	.4474	.4484	.4495	.4505	.4515	.4525	.4535	.454
1.7	.4554	.4564	.4573	.4582	.4591	.4599	.4608	.4616	.4625	.463
1.8	.4641	.4649	.4656	.4664	.4671	.4678	.4686	.4693	.4699	.470
1.9	.4713	.4719	.4726	.4732	.4738	.4744	.4750	.4756	.4761	.476

Corresponding z value is 1.96

Now the sample percentage of 70% can be used as an approximation for. population percentage P.

## Hence:

STEP = [(70(100 - 70)/400]^1/2 = 2.29%

# Confidence Limits

Estimate for population percentage = 70 +/- 1.96 x STEP Or 70 +/- 1.96 x 2.29 = 65.515% and 74.49% as the two limits for 95% confidence interval. We can round off 1.96 to 2

VU

Then with 95% confidence we estimate the population percentage with that characteristic as lying in the interval P +/- 2 x STEP

# EXAMPLE 2

A sample of 60 students contains 12 (20%) who are left handed. Find the range with 95% confidence in which the entire left handed students fall. Range =  $20 + - 2 \times \text{STEP}$ =  $20 + - 2 \times [(20 \times (100-20))/60]^{1/2}$ = 9.67% and 30.33%

# ESTIMATING PROCESS SUMMARY

1. Identify n and P (the sample size and percentage) in the sample.

2. Calculate STEP using these values.

•The 95% confidence interval is approximately P +/- 2 STEP. <u>99% confidence</u> For 99% confidence limits: z-value = 2.58.

With 99% confidence limit we have 1% chance of errors (level of significance) That mean 0.5% on each side of curve.

0.5% = 0.005

0.5 - 0.005 = 0.495

We have subtracted 0.005 from 0.5 because we find out the probability of acceptance region ( as the total probability under the curve is always 1, that mean 0.5 on right side of mean and 0.5 on left side of mean. And 0.05 is rejection region so 0.495 is acceptance region).

So 0.495 is the probability of acceptance region

Corresponding z value is 2.58 (from table, as we did in example stated above).
# FINDING A SAMPLE SIZE

To satisfy 95% confidence:  $2 \times \text{STEP} = 5$  STEP = 2.5Pilot survey value of P = 30%.  $\text{STEP} = [(30 \times 70)/n]^{1/2} = 2.5$ **Solving** 

#### n = 336

We must interview 336 persons to be 95% confident that our estimate is within 5% of the true answer.

#### DISTRIBUTION OF SAMPLE MEANS

The standard deviation of the Sampling Distribution of means is called STandard Error of the Mean STEM.

$$STEM = \frac{s.d}{\sqrt{n}}$$

s.d denotes standard deviation of the population. n is the size of the sample.

# EXAMPLE 3

What is the probability that if we take a random sample of 64 children from a population whose mean IQ is 100 with a StDev of 15, the mean IQ of the sample will be below 95? **Solution:** 

 $\overline{s} = 15$ ; n= 64; population mean = 100 STEM =  $15/(64)^{1/2} = 15/(64)^{1/2} = 15/8 = 1.875$ z = 100 - 95 /STEM = 5/1.875 = 2.67This gives a probability of 0.0038. So the chance that the average IQ of the sample is below 95 is very small.

#### LECTURE 43 HYPOTHESIS TESTING: CHI-SQUARE DISTRIBUTION PART 1

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 42
- Hypothesis testing: Chi-Square Distribution

#### EXAMPLE 1

An inspector took a sample of 100 tins of beans. The sample weight is 225 g. Standard deviation is 5 g.

Calculate with 95% confidence the range of the population mean.

Solution:

$$STEM = \frac{s.d}{\sqrt{n}}$$

s.d is not known Use s.d of sample as an approximation.

$$STEM = \frac{5}{\sqrt{100}} = 0.5$$

95% confidence interval = 225 +/- 2 x 0.5 or From 224 to 226 g

#### PROBLEM OF FAULTY COMPONENTS REVISITED

Box of 500 components may have 25 or 5% faulty components. Overall faulty items = 2% P = 2%; n= 500; STEP =  $[(2 \times 98)/500]^{1/2}$ = 0.626 **To find the probability that the sample percentage is 5% or over:** z = (5 - 2)/STEP = 3/0.626 = 4.79Area against z = 4.79 is negligible. Chance of such a sample is very small

#### FINITE POPULATION CORRECTION FACTOR

If population is very large compared to the sample then multiply STEM and STEP by the: **Finite Population Correction Factor = [1 - (n/N)]^{1/2}** Where N = Size of the population n = Size of the sample n = less than 0.1N

#### TRAINING MANAGER'S PROBLEM

New refresher course for training of workers was completed. The Training Manager would like to assess the effect of retraining if any. **Particular questions:** 

•Is quality of product better than produced before retraining?

•Has the speed of machines increased?

•Do some classes of workers respond better to retraining than others?

#### Training Manager hopes to:

• Compare the new position with established

Test a theory or hypothesis about the course

Case Study Before the course: Worker X produced 4% rejects. After the course: Out of 400 items 14 were defective = 3.5% An improvement? The 3.5% figure may not demonstrate overall improvement. It does not follow that every single sample of 400 items contains exactly 4% rejects. To draw a sound conclusion: Sampling variations must be taken into account. We do not begin by assuming what we are trying to prove NULL HYPOTHESIS. We must begin with the assumption that there is no change at all. This initial assumption is called NULL HYPOTHESIS

#### Implication of Null Hypothesis:

That the sample of 400 items taken after the course was drawn from a population in which the percentage of reject items is still 4%. NULL HYPOTHESIS EXAMPLE Data: P = 4%; n = 400 STEP  $= [P(100 - P)/n]^{1/2}$  $= [4(100 - 4)/400]^{1/2} = 0.98\%$ At 95% confidence limit: Range =  $4 + 2 \times 0.98 = 2.04$  to 5.96 % Conclusion: Sample with 3.5% rejects is not inconsistent.

No ground to assume that % rejects has changed at all. On the strength of sample there were no grounds for rejecting Null Hypothesis.

# ANOTHER EXAMPLE

Before the course: 5% rejects After the course: 2.5% rejects (10 out of 400) P = 5**STEP =** [5(100 – 5)/400]^1/2 = [5 x 95/400]^1/2 = 1.09 Range at 95 % Confidence Limits = 5 +/- 2 x 1.09 = 2.82 % to 7.18 % Conclusion: Doubt about Null Hypothesis most of the time Null hypothesis to be rejected

# PROCEDURE FOR CARRYING OUT HYPOTHESIS TEST

- 1. Formulate null hypothesis
- Calculate STEP & P +/- 2 x STEP 2.
- 3. Compare the sample % with this interval to see whether it is inside or outside If the sample falls outside the interval, reject the null hypothesis (sample differs significantly from the population %) If the sample falls inside the interval,

do not reject the null hypothesis (sample does not differ significantly from the population % at 5% level)

# **HOW THE RULE WORKS?**

Bigger the difference between the sample and population percentages, less likely it is that the population percentages will be applicable.

- When the difference is so big that the sample falls outside the 95% interval, then the population percentages cannot be applied. Null Hypothesis must be rejected
- If sample belongs to majority and it falls within 95% interval,

# then there are no grounds for doubting the Null Hypothesis

# FURTHER POINTS ABOUT HYPOTHESIS TESTING

- 99% interval requires 2.58 x STEP. Interval becomes wider. It is less likely to conclude that something is significant.
- (A) We might conclude there is a significant difference when there is none. Chance of error = 5% (type 1 Error)
   (B) We might decide that there is no significant difference when there is one (Type 2 Error)

#### LECTURE 44 HYPOTHESIS TESTING : CHI-SQUARE DISTRIBUTION PART 2

#### **OBJECTIVES**

The objectives of the lecture are to learn about:

- Review Lecture 43
- Hypothesis Testing : Chi-Square Distribution

#### FURTHER POINTS ABOUT HYPOTHESIS TESTING

This is a continuation of the points covered under Handout 43. 3. We cannot draw any conclusion regarding the direction the difference is in

# (A) Possible to do 1-tailed test

Null Hypotheis:  $P \ge 4\%$  against the alternative  $P \ge 4\%$ z = 1.64 for 5% significance level Range =  $P - 1.64 \times STEP (0.98\%)$ 

#### **Example**

Range =  $4 - 1.64 \times 0.98 = 2.39\%$ New figure = 3.5%. Hence: There is no reason to conclude that things have improved. 4. We cannot draw any conclusion regarding the direction the difference is in. (B) Possible to do 2-tailed test Null Hypothesis: P >= 4% against the alternative P> 4%z = 1.96 for 5% significance level Range = P +/-  $1.96 \times STEP (0.98\%)$ 

# Example

Range =  $4 + - 2 \times 1.96 \times 0.98 = 2.08\%$  to 5.92% New figure = 3.5% There is no reason to conclude that things have improved

#### **HYPOTHESES ABOUT MEANS**

Let us go back to the problem of retraining course discussed earlier. Before the course: Worker X took 2.5 minutes to produce 1 item. StDev = 0.5 min After the course: Foe a sample of 64 items, mean time = 2.58 min Null hypothesis No change after the course. STEM =  $s.d/(n)^{1/2} = 0.5/(64)^{1/2} = 0.0625$ Range =  $2.5 + - 2 \times 0.0625 = 2.375$  to 2.625 min

#### Conclusion:

No grounds for rejecting the Null Hypothesis. There is no change significant at 5% level.

#### ALTERNATIVE HYPOTHESIS TESTING USING Z-VALUE

z = (sample percentage - population mean)/STEP= (3.5 - 4)/0.98 = 0.51Compare it with z-value which would be needed to ensure that our sample falls in the 5% tails of distribution (1.96 or about 2). z is much less than 2.

We conclude that the probability of getting by random chance a sample which differs from the mean of 4% or more is quite high.

Certainly it is greater than the 5% significance level.

Sample is quite consistent with null hypothesis.

Null hypothesis should not be rejected.

#### PROCESS SUMMARY

- 1. State Null Hypothesis (1-tailed or 2-tailed)
- 2. Decide on a significance level and find corresponding critical value of z
- 3. Calculate sample z(sample value population value divided by STEP or STEM as appropriate)
- 4. Compare sample z with critical value of z
- 5. If sample z is smaller, do not reject the Null Hypothesis
- 6. If sample z is greater than critical value of z, sample provides ground for rejecting the Null Hypothesis.

#### TESTING HYPOTHESES ABOUT SMALL SAMPLES

Whatever the form of the underlying distribution the means of large samples will be normally distributed.

This does not apply to small samples.

We can carry out hypothesis testing using the methods discussed only if the underlying distribution is normal.

If we only know the Standard Deviation of sample and have to approximate population Standard Deviation then we use **Student's t-distribution.** 

#### STUDENT'S t-DISTRIBUTION

Student's T-Distribution is very much like normal distribution.

In fact it is a whole family of t-distributions.

As n gets bigger, t-distribution approximates to normal distribution.

t-distribution is wider than normal distribution.

95% confidence interval reflects greater degree of uncertainty in having to approximate the population Standard Deviation by that of the sample.

#### **EXAMPLE**

Mean training time for population = 10 days.

Sample mean for 8 women = 9 days.

Sample Standard Deviation = 2 days.

To approximate population Standard Deviation by a sample divide the sum of squares by n - 1:

STEM = 2/(8)<sup>1</sup>/2 = 0.71

#### Null Hypothesis:

There is no difference in overall training time between men and women.

#### t-value = (sample mean – population mean)/STEM

= (9 – 10)/0.71 = - 1.41

For n = 8, v = 8 - 1 = 7;

For 5%(.05) significance level looking at 0.025 (2-tailed):

t = 2.365 (Calculated table value)

#### Decision:

Do not reject the Null Hypothesis

# SUMMARY - I

If underlying population is normal and we know the Standard Deviation Then Distribution of sample means is normal with Standard Deviation = STEM = population s.d/(n)^1/2 and we can use a z-test.

# SUMMARY - II

If underlying population is unknown but the sample is large Then Distribution of sample means is approximately normal With StDev = STEM = population s.d/(n)^1/2 and again we can use a z-test.

# <u>SUMMARY - III</u>

If underlying population is normal but we do not know its StDev and the sample is small Then We can use the sample s.d to approximate that of the population with n - 1 divisor in the calculation of s.d.

Distribution of sample means is a t-distribution with n-1 degrees of freedom With  $% \left( {n-1}\right) =0$ 

# Standard Deviation = STEM = sample s.d/(n)^1/2

And we can use a t-test.

# SUMMARY - IV

If underlying **population is not normal** and we have a **small sample** Then **none of the hypothesis testing procedures can be safely used.** 

#### TESTING DIFFERENCE BETWEEN TWO SAMPLE MEANS

A group of 30 from production has a mean wage of 120 Rs. per day with Standard Deviation = Rs. 10. 50 Workers from Maintenance had a mean of Rs. 130 with Standard Deviation = 12 Is there a difference in wages between workers? Difference of two sample means =  $s[(1/n1) + (1/n2)]^{1/2}$  $s = [(n1.s1^2 + n2.s2^2)/(n1 + n2)]^{1/2}$ N1 = 30; n2 = 50; s1 = 10; s2 = 12  $s = [(30 \times 100 + 50 \times 144)/(30 + 50)]^{1/2} = 11.29$ Standard Error of Difference in Sample Means (STEDM) = 11.29(1/30 + 1/50)^1/2 = 2.60 z = (difference in sample means – 0)/STEDM = 120 - 130/2.60 = -3.85This is well outside the critical z for 5% significance. There are grounds for rejecting Null Hypothesis (There is difference in the two samples). PROCEDURE SUMMARY 1. State Null Hypothesis and decide significance level 2. Identify information (no. of samples, large or small, mean or proportion) and decide what standard error and what distribution are required 3. Calculate standard error Calculate z or t as difference between sample and population values divided by 4.

standard error
Compare your z or t with critical value from tables for the selected significance level; if z or t is greater than critical value, reject the Null Hypothesis

#### MORE THAN ONE PROPORTION

Look at a problem, where after the course some in different age groups shows improvement while others did not.

Let us assume that the expected improvement was uniform. An improvement of 40%, if applied to 21, 24 and 15 would give 14, 16 and 10 respectively, who improved. Let us write these values within brackets. Subtracting 14, 16 and 10 from the totals 21, 24 and 15 gives us 7, 8 and 5 respectively, who did not improve. This is the estimate if every person was affected in a uniform manner.

Let us write the observations as O, in one line (17 17 6 4 7 9).

Let us write down the expected as E, in the next line as (14 16 10 7 8 8).

Calculate O-E.

Next calculate (O-E)<sup>2</sup>.

Now standardize (O-E)^2 by dividing by E.

Calculate the total and call it  $\chi 2$ .

Age	In	nproved		Did not i	T	otal		
Under 35		17	7(14)				21	
35 – 50		17(16)		7(	8)		24	
Over 50 6(10)			9(		15			
Total		40		20	-		60	
0		17	17	6	4	7	9	
E		14	16	10	7	8	8	
O-E	3	1	-4	-3	-1	4		
(O-E)^2:	9	1	16	9	1	16		
(O-E)^2:/E:	0.643	0.0625	1.6	1.286	0.125	3.2 :	= 6.92	
	•		0 5/0					

Measurement of disagreement = Sum [(O-E)^2/E]

is known as Chi-squared (χ2)

**Degrees of freedom v** =  $(r-1) \times (c-1) = (3-1)(2-1)= 2$ 

There are tables that give Critical value of chi-squared at different confidence limits and degrees of freedom v (columns-1) x (rows-1). In the above case

v = 2-1 x 3-1 = 2

In the present case, the Critical value of chi-squared at 5% (and v = 2) = 5.991.

The value 6.92 is greater than 5.991.

This means that the Sample falls outside of 95% interval.

Null hypothesis should be rejected.

# CHI-SQUARED SUMMARY

- 1. Formulate null hypothesis (no association form)
- 2. Calculate expected frequencies
- 3. Calculate χ2
- 4. Calculate degrees of freedom (rows minus 1) x (columns minus 1); look up the critical  $\chi^2$  under the selected significance level
- 5. Compare the calculated value of  $\chi^2$  from the sample with value from the table; if the sample  $\chi^2$  is smaller (within the interval) don't reject the null hypothesis; if it is bigger (outside) reject the null hypothesis

#### CHITEST

Returns the test for independence. CHITEST returns the value from the chi-squared ( $\gamma$ 2) distribution for the statistic and the appropriate degrees of freedom. You can use  $\gamma$ 2 tests to determine whether hypothesized results are verified by an experiment.

# Syntax

#### CHITEST(actual\_range,expected\_range)

Actual\_range is the range of data that contains observations to test against expected values.

**Expected\_range** is the range of data that contains the ratio of the product of row totals and column totals to the grand total.

# Remarks

- If actual\_range and expected\_range have a different number of data points, CHITEST returns the #N/A error value.
- The  $\gamma$ 2 test first calculates a  $\gamma$ 2 statistic and then sums the differences of actual values from the expected values. The equation for this function is CHITEST=p( X> $\gamma$ 2), where:

$$\chi^{2} = \sum_{j=1}^{r} \sum_{j=1}^{c} \frac{\left(A_{jj} - E_{jj}\right)^{2}}{E_{jj}}$$

and where:

Aij = actual frequency in the i-th row, j-th column

Eij = expected frequency in the i-th row, j-th column

r = number or rows

c = number of columns

CHITEST returns the probability for a  $\gamma$ 2 statistic and degrees of freedom, df, where df = (r - 1)(c - 1).

# Example

Ĩ									
N 12	🛛 Microsoft Excel - Lecture_44 🛛 🖉 🗶								
	😰 Eile Edit View Insert Format Iools Data Window Help Type a question for help 🗸 🗗 🗙								
	D ☞ ■ ● \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$ \$								
sum ▼ X √ 1 =CHITEST(A3:B5;A7:B9)									
	A	В	C						
	Men	Women (Actual)	Description						
2	(Actual)	n ennen (/ tertaal)	2 ccompinent						
3	58	35	Agree						
4	11	25	Neutral						
5	10 23		Disagree						
	Men	Women (Expected)	Description						
6	(Expected)		Decemption						
7	45.35	47.65	Agree						
8	17.56	18.44	Neutral						
9	16.09	16.91	Disagree						
10	A3:B5;A7:	The γ2 statistic fo	r the data above is 16.16957						
11	B9)	with 2 degrees of	freedom (0.000308)						

The above example shows two different groups. The calculation shows that the probability for chi-squared 16.16957 with 2 degrees of freedom was 0.000308, which is negligible.

# **OBJECTIVES**

The objectives of the lecture are to learn about:

- **Review Lecture 44**
- Planning Production Levels: Linear Programming

#### INTRODUCTION TO LINEAR PROGRAMMING

A Linear Programming model seeks to maximize or minimize a linear function, subject to a set of linear constraints. The linear model consists of the following components: A set of decision variables, x<sub>i</sub>. An objective function,  $\sum c_i x_i$ . A set of constraints,  $\sum a_{ii} x_i < b_i$ .

# THE FORMAT FOR AN LP MODEL

Maximize or minimize  $\sum c_i x_i = c_1 x_1 + c_2 x_2 + \dots + c_n x_n$ Subject to  $a_{ii} x_i \le b_i$ , i = 1,,,,,m Non-negativity conditions: all  $x_i \ge 0$ , j = 1, ,n Here n is the number of decision variables. Here m is the number of constraints. (There is no relation between n and m)

#### THE METHODOLOGY OF LINEAR PROGRAMMING

- Define decision variables 1.
- 2. Hand-write objective
- 3. Formulate math model of objective function
- Hand-write each constraint 4.
- 5. Formulate math model for each constraint
- Add non-negativity conditions 6.

# THE IMPORTANCE OF LINEAR PROGRAMMING

Many real world problems lend themselves to linear programming modeling. Many real world problems can be approximated by linear models.

There are well-known successful applications in:

- Operations
- Marketing
- Finance (investment) .
- Advertisina
- Agriculture

There are efficient solution techniques that solve linear programming models.

The output generated from linear programming packages provides useful "what if" analysis.

#### ASSUMPTIONS OF THE LINEAR PROGRAMMING MODEL

- The parameter values are known with certainty 1.
- The objective function and constraints exhibit constant returns to scale 2.
- 3. There are no interactions between the decision variables (the additivity assumption)

The Continuity assumption: Variables can take on any value within a given feasible range.

# A PRODUCTION PROBLEM – A PROTOTYPE EXAMPLE

A company manufactures two toy doll models: Doll A

#### Doll B

# **Resources are limited to:**

1000 kg of special plastic. 40 hours of production time per week.

#### Marketing requirement:

Total production cannot exceed 700 dozens.

Number of dozens of Model A cannot exceed number of dozens of Model B by more than 350.

The current production plan calls for:

- Producing as much as possible of the more profitable product, Model A (Rs. 800 profit per dozen).
- Use resources left over to produce Model B (Rs. 500 profit • per dozen), while remaining within the marketing guidelines.

# Management is seeking:

a production schedule that will increase the company's profit A linear programming model can provide: an insight and an intelligent solution to this problem

# **Decisions variables:**

 $X_1$  = Weekly production level of Model A (in dozens)  $X_2$  = Weekly production level of Model B (in dozens).

# **Objective Function:**

Weekly profit, to be maximized Maximize  $800X_1 + 500X_2$ (Weekly profit) subject to  $2X_1 + 1X_2$ 1000 < (Plastic) $3X_1 + 4X_2$ 2400 < (Production Time)  $X_1 + X_2$ 700 < (Total production) X<sub>1</sub> - X<sub>2</sub> 350 <u><</u> (Mix)  $X_i > = 0, j = 1,2$ (Nonnegativity)

#### ANOTHER EXAMPLE

A dentist is faced with deciding: how best to split his practice between the two services he offers-general dentistry and pedodontics? (children's dental care)

Given his resources,

how much of each service should he provide

to maximize his profits?

The dentist employs three assistants and uses two operatories.

Each pedodontic service requires .75 hours of operatory time, 1.5 hours of an assistant's time and .25 hours of the dentist's time

A general dentistry service requires .75 hours of an operatory, 1 hour of an assistant's time and .5 hours of the dentist's time.

Net profit for each service is Rs. 1000 for each pedodontic service and Rs. 750 for each general dental service.

Time each day is: eight hours of dentist's, 16 hours of operatory time, and 24 hours of assistants' time.

#### THE GRAPHICAL ANALYSIS OF LINEAR PROGRAMMING

Using a graphical presentation, we can represent: all the constraints, the objective function, and the three types of feasible points.

#### **GRAPHICAL ANALYSIS – THE FEASIBLE REGION**

The slide shows how a feasible region is defined with non-negativity constraints.

# GRAPHICAL ANALYSIS – THE FEASIBLE REGION

# THE SEARCH FOR AN OPTIMAL SOLUTION

The figure shows how different constraints can be represented by straight lines to define a feasible region. There is an area outside the feasible region that is infeasible.

It may be seen that each of the constraints is a straight line. The constraints intersect to form a point that represents the optimal solution. This is the point that results in maximum profit of 436,000 Rs. As shown in the slide below. The procedure is to start with a point that is the starting point say 200,000 Rs. Then move the line upwards till the last point on the feasible region is reached. This region is bounded by the lines representing the constraints.

# THE SEARCH FOR AN OPTIMAL SOLUTION

#### SUMMARY OF THE OPTIMAL SOLUTION

Model A = 320 dozen Model B = 360 dozen Profit = Rs. 436000 This solution utilizes all the plastic and all the production hours. Total production is only 680 (not 700). Model a production does not exceed Model B production at all. EXTREME POINTS AND OPTIMAL SOLUTIONS If a linear programming problem has an extinged solution, on externa point

If a linear programming problem has an optimal solution, an extreme point is optimal.

# EXTREME POINTS AND OPTIMAL SOLUTIONS

 If a linear programming problem has an optimal solution, an extreme point is optimal.

#### **MULTIPLE OPTIMAL SOLUTIONS**

There may be more than one optimal solutions. However, the condition is that the objective function must be parallel to one of the constraints. If a weightage average of different optimal solutions is obtained, it is also an optimal solution.

# MULTIPLE OPTIMAL SOLUTIONS

 For multiple optimal solutions to exist, the objective function must be parallel to one of the constraints

# Some useful functions of Excel

AMORDEGRC	Returns the depreciation of an asset, for each accounting period by using depreciation coefficient (French accounting system)
AMORLINC	Returns the depreciation of an asset, for each accounting period (French accounting system)
AVERAGE	Returns the average of its arguments
AVERAGEA	Returns the average of its arguments, including numbers, text, and logical values
BINOMDIST	Returns the Binomial Distribution Probability
CHITEST	Returns the test for independence. CHITEST returns the value from the chi-squared ( $\chi^2$ ) distribution for the statistic and the appropriate degrees of freedom.
COMBIN	Returns Number of Combinations for a Given Number of Items
CORREL	Returns the correlation coefficient between two data sets
COUNT	Counts how many numbers are in the list of arguments
COUNTA	Counts the number of cells that are not empty and the values within the list of arguments.
COUNTBLANK	Counts the number of blank cells within a range
COUNTIF	Counts the number of nonblank cells within a range that meet the given criteria
COVAR	Returns covariance
CRITBINOM	Returns smallest value for which the Cumulative Binomial Distribution is less than or equal to a criterion value.
CUMIPMT	Returns cumulative interest paid between two periods
CUMPRINC	Returns cumulative principal paid on a loan between two periods
DAVERAGE	Averages the values that match specified conditions
DB	Returns depreciation of an Asset for a specified period using fixed- declining balance method.
DDB	Returns the depreciation of an asset for a specified period by using the double-declining balance method or some other method that you specify.
DPRODUCT	Multiplies the values in a list that match the specified condition.
DSUM	Adds the numbers in a list that match specified conditions.

EFFECT	Returns effective annual interest rate
EVEN	Rounds Up to the Nearest Even Integer
EXP	e Raised to the Power of a Given Number
FACT	Returns factorial of a Number
FORECAST	Prediction by Trend.
FREQUENCY	Returns a frequency distribution as a vertical array
FV	Returns future Value of an Investment
FVSCHEDULE	Returns Future value of an initial principal with variable interest rate.
GEOMEAN	Returns Geometric Mean of Positive Numeric Data
HARMEAN	Returns Harmonic Mean of Positive Numbers
INT	Rounds to the Nearest Integer
INTERCEPT	Calculates Point Where Line Will Intersect Y Axis
IPMT	Returns the interest payment for an investment for a given period
IRR	Returns the internal rate of return for a series of cash flows
ISPMT	Calculates the interest paid during a specific period of an investment
LN	Returns Natural Logarithm of a number
LOG	Returns Logarithm of a Number to a Specified Base
LOG10	Returns Base 10 Logarithm of a number
MEDIAN	Gives Median or Number in Middle
MDETERM	Matrix Determinant of an Array
MINVERSE	Gives Inverse Matrix for the Matrix Stored in an Array
MIRR	Returns the internal rate of return where positive and negative cash flows are financed at different rates
MMULT	Matrix Product of Two Arrays
MODE	Returns Most Frequent Value of an Array
NEGBINOMDIST	Returns Negative Binomial Distribution
NOMINAL	Returns annual nominal interest rate
NORMDIST	Returns Normal Cumulative Distribution
NORMSINV	Returns Inverse of Normal Cumulative Distribution

NPER	Returns Number of Periods for an Investment
NPV	Returns the net present value of an investment based on a series of periodic cash flows and a discount rate
ODD	Rounds Number Up to the Nearest Odd Integer
PERCENTILE	Returns K-th Percentile of Values in a Range
PERMUT	Returns Number of Permutations for a Given Number of Objects
PMT	Returns the periodic payment for an annuity
POISSON	Returns Poisson Distribution
POWER	Returns the result of a Number Raised to a Power
PPMT	Returns the payment on the principal for an investment for a given period
PRODUCT	Multiplies All Numbers
PV	Returns Present Value of an Investment
QUARTILE	Returns Specified Quartile of Data Set
RATE	Returns Interest Rate of a Loan or Annuity
ROUND	Rounds Number to a Specific Number of Digits
ROUNDDOWN	Rounds Number Down Towards Zero
ROUNDUP	Rounds Number Up Away From Zero
RSQ	Returns Square of Pearson Product Moment Correlation Coefficient
SLN	Returns the straight-line depreciation of an asset for one period
SLOPE	Returns Slope of a Linear Regression Line
SQRT	Returns Square Root of a Number
STDEV	Estimates standard deviation based on a sample
STDEVA	Estimates standard deviation based on a sample, including numbers, text, and logical values
STDEVP	Calculates standard deviation based on the entire population
SUBTOTAL	Returns a Subtotal in a List
SUM	Add all numbers in a range of cells.
SUMIF	Adds Specified Cells
SUMPRODUCT	Multiplies Array and Gives Sum

SUMSQ	Square Numbers and Then Add
SYD	Returns the sum-of-years' digits depreciation of an asset for a specified period
TREND	Return Values Along Linear Trend
TRUNC	Truncates to an Integer by Removing Fractional Part
VAR	Estimate Variance from Sample
VARP	Calculates Variance from entire Population
VDB	Returns the depreciation of an asset for a specified or partial period by using a declining balance method. VDB stands for variable declining balance.
XIRR	Returns internal rate of return for a schedule of cash flows that is not necessarily periodic.
XNPV	Returns net present value for a schedule of cash flows that is not necessarily periodic.
